Types of Saturation - Chemistry LibreTexts

An unsaturated solution is a chemical solution in which the solute concentration is lower than its equilibrium solubility. All of the solute dissolves in the solvent. When a solute (often a solid) is added to a solvent (often a liquid), two processes occur simultaneously.

What Is an Unsaturated Solution in Chemistry?

IUPAC definition. According to the IUPAC definition, solubility is the analytical composition of a saturated solution expressed as a proportion of a designated solute in a designated solvent.

Solubility may be stated in various units of concentration such as molarity, molality, mole

fraction, mole ratio, mass (solute) per volume (solvent) and other units.

Unsaturated solutions are solutions in which the amount of dissolved solute is less than the saturation point of the solvent (at that specific temperature gradient). If the amount of dissolved solute is equal to the saturation point of the solvent, the solution is called a saturated solution. To form a mixture, two or more substances must be mixed.

[Meaning Of Unsaturated Solution](#)

The definition of a supersaturated solution is one which contains more dissolved solute than could ordinarily

dissolve into the solvent. A minor disturbance of the solution or introduction of a "seed" or tiny crystal of solute will force crystallization of excess solute. One way supersaturation can occur is by carefully cooling a saturated ...

A solution that is unsaturated does not have excess material or solvent within the liquid.

Unsaturated solutions have the potential to effectively dissolve more material before reaching the point of full saturation. A saturated solution is as saturated as it can possibly be under normal conditions.
