We are two engineers who took and passed the first revision of the updated 2017 PE exam for Mechanical Engineering-Machine Design and Materials, and we wanted to provide a resource to help fellow engineers study more efficiently for the test. This practice exam contains 80 problems we created that we believe are an excellent representation of the test. Looking back, we can see that working problems similar to the exam was the most beneficial thing we did to prepare. They got us familiar with the structure of the PE exam and showed us which topics we needed to study more; unfortunately, most of the materials we used to study had practice problems that were either too complicated, in strange formats, or led us to study unnecessary concepts. In other words, this is the study material that we wish we had while studying for the exam.

This book is about making machine learning models and their decisions interpretable. After exploring the concepts of interpretability, you will learn about simple, interpretable models such as decision trees, decision rules and linear regression. Later chapters focus on general model-agnostic methods for interpreting black box models like feature importance and accumulated local effects and explaining individual predictions with Shapley values and LIME. All interpretation methods are explained in depth and discussed critically. How do they work under the hood? What are their strengths and weaknesses? How can their outputs be interpreted? This book will enable you to select and correctly apply the interpretation method that is most suitable for your machine learning project.
