The goal of the first edition of *Interventional Critical Care: A Manual for Advanced Care Practitioners* was to fill a knowledge gap of the advanced practice provider (APP) specifically regarding the skills and understanding of critical care procedures in response to the rapidly expanding participation of APPs in critical care. Written by experts in the field, this successor edition adds to the content of the first by expanding upon ultrasonography areas to include more direct hemodynamic evaluations as well as the newer "e"FAST. It also explores the specialty of Urology to include more complex interventions. As billing and coding are necessary, the authors added appropriate CPT codes for each of the appropriate chapters. Most chapters have been completely re-written and updated from the first edition and have different authors – thereby a different perspective and experience level. *Interventional Critical Care 2nd Edition* serves as a valuable reference for physicians and advanced practice providers in daily practice in the ICU, OR and/or ED setting. *Estimated Useful Lives of Depreciable Hospital Assets, 2018 Edition* Aspen Pub CPT(R) 2020 Professional Edition is the definitive AMA-authored resource to help health care professionals correctly report and bill medical procedures and services.

Management decisions on appropriate practices and policies regarding tropical forests often need to be made in spite of innumerable uncertainties and complexities. Among the uncertainties are the lack of formalization of lessons learned regarding the impacts of previous programs and projects. Beyond the challenges of generating the proper information on these impacts, there are other difficulties that relate with how to socialize the information and knowledge gained so that change is transformational and enduring. The main complexities lie in understanding the interactions of social-ecological systems at different scales and how they varied through time in response to policy and other processes. This volume is part of a broad research effort to develop an independent evaluation of certification impacts with stakeholder input, which focuses on FSC certification of natural tropical forests. More specifically, the evaluation program aims at building the evidence base of the empirical biophysical, social, economic, and policy effects that FSC certification of natural forest has had in Brazil as well as in other tropical countries. The contents of this volume highlight the opportunities and constraints that those responsible for managing natural forests for timber production have experienced in their efforts to improve their practices in Brazil. As such, the goal of the studies in this volume is to serve as the foundation to design an impact evaluation framework of the impacts of FSC certification of natural forests in a participatory manner with interested parties, from institutions and organizations, to communities and individuals.

CI/ASCE Standard 38-02 presents a credible system for classifying the quality of utility location information that is placed in design plans. The Standard addresses issues such as: how utility information can be obtained, what technologies are available to obtain that information; how that information can be conveyed to the information users; who should be responsible for typical collection and depiction tasks; what factors determine which utility quality level attribute to assign to data; and what the relative costs and benefits of the various quality levels are. Used as a reference or as part of a specification, the Standard will assist engineers, project and utility owners, and constructors in developing strategies to reduce risk by improving the reliability of information on existing subsurface utilities in a defined manner.
