An Introduction McGraw-Hill

Hua-yen is regarded as the highest form of

Buddhism by most modern Japanese and Chinese scholars. This book is a description and analysis of the Chinese form of Buddhism called Hua-yen (or Hwa-yea), Flower Ornament, based largely on one of the more systematic treatises of its third patriarch. Hua-yen Buddhism strongly resembles Whitehead's process philosophy, and has strong implications for modern philosophy and religion. Hua-yen Buddhism explores the philosophical system of Hua-yen in greater detail than does Garma C.C. Chang's *The Buddhist Teaching of Totality* (Penn State, 1971). An additional value is the development of the questions of ethics and history. Thus, Professor Cook presents a valuable sequel to Professor Chang's pioneering work. The Flower Ornament School was developed in China in the late 7th and early 8th centuries as an innovative interpretation of Indian Buddhist doctrines in the light of indigenous Chinese presuppositions, chiefly Taoist. Hua-yen is a cosmic ecology, which views all existence as an organic unity, so it has an obvious appeal to the modern individual, both students and layman.

Forest trees play crucial roles as an alternative bioenergy source and are key to pollution abatement and the maintenance of biodiversity. However, major threats to the sustainable supply of forest tree products are adverse climate, pests and diseases, despite the extensive efforts to control them. Today, the need to increase and safeguard those resources of renewable materials and bioenergy present major challenges for tree health biotechnology and bioeconomy programs. Ecologically, forest trees share overlapping habitat to diverse range of microbes and maintain a dynamic balanced relationship. Many of these microbes have been found to have important impacts on tree health/forest ecology and their evolution and are key components in maintaining vital ecosystem processes. *Forest Microbiology, Volume 2: Forest Tree Health* highlights a range of emerging microbial phytopathogens of forest trees as well as novel approaches to managing tree pests and diseases in a changing climate. An overview of selected microbial pathogens of forest trees, with an emphasis on their biology, life cycle, spreading mechanisms, impact on affected tree species and current and prospective control strategies is covered in detail. At the same time, the impact of tree microbiomes on host fitness is discussed. Beneficial components of tree microbiota are presented, and their functional role in tree nutrition, immunity and disease resistance are outlined. Possible implications of antagonism within tree microbial communities for disease control and prevention is also discussed. Furthermore, this volume addresses the many functions of microbial disease agents of trees including fungi, bacteria, viruses and phytoplasma. Strong emphasis is placed on the genetics, biochemistry, physiology, evolutionary biology and population dynamics of the microorganisms involved. This title is a key resource

for foresters and forest pathology practitioners, as well as plant biologists and pathologists, researchers and academics studying plant science. An Introduction John Wiley & Sons

Trans Dilemmas presents the findings of a three-year research project which examined the lived experiences of trans people in Australia's Northern Territory. The book argues that whilst trans people, who live in remote areas, experience issues which may not be distinct from those living in urban areas and the inner-city, these issues can be aggravated by geographic and demographic factors. By conducting online surveys and in-depth interviews, Stephen Kerry brings to light the issues for transgender people which are compounded by living in sparsely populated, remote communities. Namely social isolation, maintaining relationships with friends, family and partners, and the difficulties accessing health care. The book also includes significant findings on the experiences and treatment of Australia's trans Aboriginal people, also known as sistergirls and brotherboys. An analysis of first-person narratives by sistergirls and brotherboys reveals the racism within predominantly white trans communities and transphobia within traditional Aboriginal communities, which they are uniquely faced with. Trans Dilemmas represents an important contribution to contemporary research into the lives of transgender Australians. It gives a voice to those transgender people living in the more isolated communities in Australia, which up until now, have been largely unheard. For students and researchers in Queer Studies and Gender Studies, this is valuable reading.

In 1942 the threat of Japanese invasion hung over Australia. The men were away overseas, fighting on other fronts, and civilians were left unprotected at home. Following the attack on Pearl Harbor and the Japanese advance south, Prime Minister Curtin ordered state governments to prepare. From January 1942, a team frantically pulled together secret plans for a 'scorched earth' strategy. The goal was to prevent the Japanese from seizing resources for their war machine as they landed, and capturing Australians as slaves as they had done in Malaya and elsewhere in Asia. From draining domestic water tanks to sinking dinghies and burning crops, from training special citizen squads to evacuating coastal towns, 'Total war, total citizen collaboration' was the motto. Today these plans vividly evoke the fraught atmosphere of the year Australia was threatened with invasion. After the war these top secret plans were forgotten. This is the first time they have ever been made public. 'This is a treasure trove, a gold mine, a Christmas-every-day cornucopia of rich Australian history...' Peter Grose, author of *An Awkward Truth* and *A Very Rude Awakening*.
