Due to a historical lack of attention to the importance of modelling, measuring and managing risk, senior bank leaders are struggling to implement unified practices within their financial institutions that could address the gaps posed by risky management behaviour, rogue trading, liquidity crises, prohibited investments in mortgage-backed securities, and default risks aligned with loans. This book discusses the theories at play between bank agents (bank managers) and their principals (shareholders), a topic which has gained importance as a result of the banking crisis, and similarly, governed the need for more efficient risk management and ethical managerial practices. The author worked with a senior bank leadership team to identify and describe effective capital regulation practices that can lead to a reduction in loss and risky management behavioural practices. The book

offers consensus on a number of activities that bank managers can implement to address bank risk. It analyses the relevant factors that determine the necessity for banking regulation and the important role of regulation in managing banking crises. The author's analysis of the important regulatory aspects in developed countries such as the US, offers a useful conceptual framework for creating an adequate banking regulatory environment in developing countries. This book offers an original contribution to the field of banking that undergraduate, masters, PhD students, academics and researchers can use to gain a deeper understanding of the constructs at play in the banking industry.

This book is about coding interview questions from software and Internet companies. It covers five key factors which determine performance of candidates: (1) the basics of programming languages, data structures and algorithms, (2) approaches to writing code with high quality, (3) tips to solve difficult problems, (4) methods to optimize code, (5) soft skills required in interviews. The basics of languages, algorithms and data structures are discussed as well as questions that explore how to write robust solutions after breaking down problems into manageable pieces. It also includes examples to focus on modeling and creative problem solving. Interview questions from the most popular companies in the IT industry are taken as examples to illustrate the five factors above. Besides solutions, it contains detailed analysis, how interviewers evaluate solutions, as well as why they like or dislike them. The author makes clever use of the fact that interviewees will have limited time to program meaningful solutions which in turn, limits the options an interviewer has. So the author covers those bases. Readers will improve their interview performance after reading this book. It will be beneficial for them even after they get offers, because its topics, such as approaches to analyzing difficult problems, writing robust code and

optimizing, are all essential for high-performing coders.

Food insecurity is a complex 'wicked' problem that results from a range of unstable and uncertain physical, social, cultural and economic factors that limits access to nutritious food. Globally, 800 million people are under-nourished, and around 2 billion are overweight/obese or have micronutrient deficiency. These populations are largely positioned in developing countries where disease burden is high and impacts health budgets and productivity. Similarly developed countries, cities and neighbourhoods are experiencing a greater emergence of vulnerable populations. This is in part explained by the change in the food production and manufacturing, the retraction in economic climates, the increase in food price, and in some regions reduced food availability and access. Vulnerable groups include but are not limited to migrant populations, Indigenous people, elderly, pregnant women, those with disability, homeless, young children and youth. Poor nutrition at significant periods of growth and development and during life impact long term health outcomes increasing non-communicable disease prevalence, health cost and reducing economic productivity.
