Traumatic brain injury (TBI) may affect 10 million people worldwide.
It is considered the "signature wound" of the conflicts in Iraq and
Afghanistan. These injuries result from a bump or blow to the head, or
from external forces that cause the brain to move within the head, such
as whiplash or exposure to blasts. TBI can cause an array of physical
and mental health concerns and is a growing problem, particularly
among soldiers and veterans because of repeated exposure to violent
environments. One form of treatment for TBI is cognitive
rehabilitation therapy (CRT), a patient-specific, goal-oriented
approach to help patients increase their ability to process and interpret
information. The Department of Defense asked the IOM to conduct a
study to determine the effectiveness of CRT for treatment of TBI.

Prior to the military conflicts in Iraq and Afghanistan, wars and
conflicts have been characterized by such injuries as infectious
diseases and catastrophic gunshot wounds. However, the
signature injuries sustained by United States military personnel in
these most recent conflicts are blast wounds and the psychiatric
consequences to combat, particularly posttraumatic stress disorder
(PTSD), which affects an estimated 13 to 20 percent of U.S.
service members who have fought in Iraq or Afghanistan since
2001. PTSD is triggered by a specific traumatic event - including
combat - which leads to symptoms such as persistent re-
experiencing of the event; emotional numbing or avoidance of
thoughts, feelings, conversations, or places associated with the
trauma; and hyperarousal, such as exaggerated startle responses
or difficulty concentrating. As the U.S. reduces its military
involvement in the Middle East, the Departments of Defense
(DoD) and Veterans Affairs (VA) anticipate that increasing
numbers of returning veterans will need PTSD services. As a
result, Congress asked the DoD, in consultation with the VA, to
sponsor an IOM study to assess both departments' PTSD
treatment programs and services. Treatment for Posttraumatic
Stress Disorder in Military and Veteran Populations: Initial
Assessment is the first of two mandated reports examines some of
the available programs to prevent, diagnose, treat, and
rehabilitate those who have PTSD and encourages further
research that can help to improve PTSD care.

Mild Traumatic Brain Injury Rehabilitation Toolkit John Wiley &

This is the first neuropsychology book to translate exciting
findings from the recent explosion of research on sport-related
concussion to the broader context of mild traumatic brain injury
(MTBI) and post-concussive syndrome (PCS) in the general
population. In addition, it includes a Continuing Education (CE)
component administered by the American Academy of Clinical

Neuropsychology. Traumatic brain injuries constitute a major
global public health problem, but until now, MTBIs, which
constitute up to 90 percent of all treated TBIs, have been difficult
to evaluate and manage clinically because of the absence of a
viable model. Dr. McCrea's book thus provides a welcome
evidence base for all clinicians - including psychologists,
neuropsychologists, neurologists, neurosurgeons, rehabilitation
medicine physicians, physiatrists, and nurses - involved in the
clinical diagnosis and treatment of MTBI, as well as attorneys
involved in personal injury litigation and personal injury defense.
Each section of the book ends with a helpful summary of the 'Top
10 Conclusions.' Instructions for earning AACN-administered CE
credit are included.

A RAND study, the first to examine care received by a census of active-duty service members diagnosed with mild traumatic brain injury in the Military Health System, assessed the number and characteristics of these patients (including deployment history and history of traumatic brain injury), their care settings, the treatments they received, co-occurring conditions, the duration of treatment, and the risk factors for requiring long-term care. Understanding Treatment of Mild Traumatic Brain Injury in the Military Health System Oxford University Press, USA

Up to 10% of people will suffer a mild head injury (or 'mild traumatic brain injury') in their lifetime and up to 50% of those people will also find they have lingering post-concussion symptoms in the months or years afterwards. These symptoms can include headaches, dizziness, fatigue, irritability, sleep disturbance, reduced day-to-day memory, poor concentration, taking longer to think, 'muzzy' headedness, depression, anxiety, tinnitus, blurred or double vision, sensitivity to light or noise, frustration, nausea, restlessness and sensitivity to alcohol. In such circumstances the 'mild' head injury may feel anything but mild. This is particularly so if large areas of your day to day life are affected. People in these circumstances can have their difficulties compounded by the very different explanations for their persisting difficulties. These usually involve receiving contradictory opinions about the extent to which ongoing symptoms are caused by neurological brain injury or other factors. These complicating factors can make it very difficult to find the right kind of service or expertise after a TBI. Patients can easily feel like they are being "pushed from pillar to post" when trying to find services that can help with their problems. On top of all of this, there is a distinct lack of good, science-based information for patients about the best ways to manage PCS. It is therefore very common for those who experience prolonged difficulties to find their situation extremely confusing, frustrating and stressful. Dr Nigel King is an expert with much experience in this area, and has written a very valuable book weaving together the most useful knowledge in this area. It clarifies some of the complex issues for those who suffer with prolonged problems and provides practical, science-based self-help guidance for managing TBI difficulties. Using cognitive rehabilitation techniques and CBT approaches for the associated mental health complications of PCS, this much need book provides help, hope and understanding for what can be a highly disabling and misunderstood condition.

Neuroscience for Social Work Simon and Schuster

Neurotrauma: A Comprehensive Textbook on Traumatic Brain Injury and Spinal Cord Injury aims to bring together the latest clinical practice and research in the field of two forms of trauma to the central nervous system: namely traumatic brain injury (TBI) and spinal cord injury (SCI). Nationally, more 1.9 million Americans sustain a traumatic brain injury annually. In parallel, there are an estimate of 12,000 new cases of SCI in the United States annually. In addition,

approximately 1.2 million people live with paralysis due to SCI. In recent years, dramatic advancements in the field have resulted in much improved outcomes for patients and higher standards of care. This volume details the latest research and clinical practice in the treatment of neurotrauma, in a comprehensive but easy-to-follow format.

Neurotrauma is a valuable resource for any clinician involved in caring for TBI and SCI patients, clinical research professionals, researchers, medical and graduate students, and nurse specialists.

Traumatic brain injury (TBI) accounts for up to one-third of combat-related injuries in Iraq and Afghanistan, according to some estimates. TBI is also a major problem among civilians, especially those who engage in certain sports. At the request of the Department of Defense, the IOM examined the potential role of nutrition in the treatment of and resilience against TBI.

Mild Traumatic Brain Injury in Children and Adolescents

Department of the Army

Despite the increased public awareness of traumatic brain injury (TBI), the complexities of the neuropsychiatric, neuropsychological, neurological, and other physical consequences of TBI of all severities across the lifespan remain incompletely understood by patients, their families, healthcare providers, and the media. Keeping pace with advances in the diagnosis, treatment, and science of TBI, the Textbook of Traumatic Brain Injury, Third Edition, comprehensively fills this gap in knowledge. Nearly all 50 chapters feature new authors, all of them experts in their field. Chapters new to this edition include biomechanical forces, biomarkers, neurodegenerative dementias, suicide, endocrine disorders, chronic disease management, and social cognition. An entirely new section is devoted to the evaluation and treatment of mild TBI, including injuries in athletes, military service members and veterans, and children and adolescents. These chapters join newly updated sections on the assessment and treatment of the cognitive, emotional, behavioral, and other physical sequelae of TBI. The Textbook of Traumatic Brain Injury is a must-read for all of those working in any of the multitude of disciplines that contribute to the care and rehabilitation of persons with brain injury. This new volume is also a potentially useful reference for policymakers in both the public and private sectors.
