Dissatisfied with the explanations of previous researchers, Richard Andrews and Paul Schellenberger applied mathematical logic to the enduring mystery of Rennes-le-Château and the “treasure” alleged to be buried there. Beginning with a healthy skepticism, they assumed the enigma would wither under scrutiny. The quest began with an investigation into the activities of a group of 19th-century priests, but as the trail was pursued, it became apparent that the mystery’s scope stretched far beyond the mountains of southern France. A series of paintings, maps, and tombstones pointed to one very specific location. The authors combined their knowledge of archaeology, theology, and surveying to produce a startling account of what they believe to be the true events surrounding the burial of Jesus. "The present study is not a biography; nor does it represent a complete examination of everything which Smollett wrote after 1753, the date which I have chosen to mark the beginning of Smollett's "later career". Most of this study is limited to what appears to be the most important and the most neglected aspect of Smollett's later career - an aspect linked with a dominant intellectual trend of the eighteenth century. It has long been noted that Smollett's later creative works, 'Travels through France and Italy', 'Adventures of an atom', and 'Humphry Clinker', are radically different from his earlier creative works, 'Roderick Random', 'Peregrine Pickle', and 'Ferdinand Count Fathom'. It has also been noted, much less frequently, that his prose style underwent a considerable change in the later works. But the causes and exact nature of these changes have barely been suggested. Between 1753 and 1766 Smollett published no creative work except 'Sir Launcelot Greaves', some small pieces of verse and the short farce, 'The reprisal'; and it has long been known that these years of his life were chiefly occupied by manifold literary drudgery: compiling, editing, translating, reviewing, pamphleteering. But the nature and extent of these labors have never been adequately investigated. These gaps in our knowledge of Smollett are intimately related. A study of Smollett's literary drudgery reveals the fundamental causes and helps to ascertain the nature of the changes found in Smollett's later creative works. A study of Smollett's compilations, in particular, helps to connect the later creative works with the contemporary trend toward the accumulation and synthesis of facts, historical, topographical, and scientific. In the gradual movement towards classification and synthesis of knowledge, Smollett's work as editor and compiler proves to be of prime significance. This trend also appears to have a strong connection with the peculiar prose style known as "Johnsonian"." -- preface, p. [vii].

This book provides a detailed study of the Atomic Layer Epitaxy technique (ALE), its development, current and potential applications. The rapid development of coating technologies over the last 25 years has been instrumental in generating interest and expertise in thin films of materials, and indeed the market for thin film coatings is currently £3 billion with projected annual growth of 20 to 30% [1]. ALE is typical of thin-film processes in that problems in the processing or preparation of good quality epitaxial films have been overcome, resulting in better performance, novel applications of previously unsuitable materials, and the development of new devices. Many materials exhibit interesting and novel properties when prepared as thin films and doped. Vapour-deposited coatings and films are used extensively in the semiconductor and related industries for making single devices, integrated circuits, microwave hybrid integrated circuits, compact discs, solar reflective glazing, fibre optics, photo voltaic cells, sensors, displays, and many other products in general, everyday use. The ALE technique was developed by a research team led by Tuomo Suntola, working for Instrumentarium Oy in Finland. The key members of this team were Iorma Antson, Arto Pakkala and Sven Lindfors. In 1977, the research team moved from Instrumentarium to Lohja Corporation, where they continued the development of ALE and were granted a patent in the same year. By 1980, the technique was sufficiently advanced that they were producing flat-screen electroluminescent displays based on a manganese-doped zinc sulphide layer.
