Analysis and Modeling of Manufacturing Systems is a set of papers on some of the newest research and applications of mathematical and computational techniques to manufacturing systems and supply chains. These papers deal with fundamental questions (how to predict factory performance: how to operate production systems) and explicitly treat the stochastic nature of failures, operation times, demand, and other important events.

Manufacturing Systems Modeling and Analysis
The parameter coupling technique for CLMSs is more flexible for modeling and analyzing various closed loop manufacturing systems than the traditional queuing networks approach because the parameter coupling technique presented in this paper is independent from the specific open manufacturing models (exponential processing time models, continuous fluid models, deterministic models, etc.).
