The Social Meaning of Modern Biology analyzes the cultural significance of recurring attempts since the time of Darwin to extract social and moral guidance from the teachings of modern biology. Such efforts are often dismissed as ideological defenses of the social status quo, of the sort wrongly associated with nineteenth-century social Darwinism. Howard Kaye argues they are more properly viewed as culturally radical attempts to redefine who we are by nature and thus rethink how we should live. Despite the scientific and philosophical weaknesses of arguments that "biology is destiny," and their dehumanizing potential, in recent years they have proven to be powerfully attractive. They will continue to be so in an age enthralled by genetic explanations of human experience and excited by the prospect of its biological control. In the ten years since the original edition of *The Social Meaning of Modern Biology* was published, changes in both science and society have altered the terms of debate over the nature of man and human culture. Kaye's epilogue thoroughly examines these changes. He discusses the remarkable growth of ethology and sociobiology in their study of animal and human behavior and the stunning progress achieved in neuropsychology and behavioral genetics. These developments may appear to bring us closer to long-sought explanations of our physical, mental, and behavioral "machinery." Yet, as Kaye demonstrates, attempts to use such explanations to unify the natural and social sciences are mired in self-contradictory accounts of human freedom and moral choice. *The Social Meaning of Modern Biology* remains a significant study in the field of sociobiology and is essential reading for sociologists, biologists, behavioral geneticists, and psychologists.

The volume presents phenomena of classification and categorisation in ancient and modern cultures and provides an

overview of how cultural practices and cognitive systems interact when individuals or larger groups conceptually organize their world. Scientists of antiquity studies, anthropologists, linguists etc. will find methods to reconstruct early concepts of men and nature from a synchronic and diachronic comparative perspective.

The theory of evolution is considered the unifying theory of biology. An accurate understanding of evolution is vital both for the understanding of diverse topics in

biology, but also for societal issues such as antibiotic resistance or biodiversity. In contrast, decades of research in science education have revealed that students have difficulties to accurately understand evolutionary processes such as mutation and natural selection. The majority of this research relies on a conceptual framework of so-called key concepts (variation, selection, inheritance), derived from scholarly descriptions of natural selection. Recent research suggests that non-domain specific concepts such as randomness, probability, spatial and temporal scales, so called threshold concepts, are important for evolution understanding in addition to the key concepts. Thus, many important elements of evolutionary theory are counter-intuitive or lie outside direct perception. Hence, representations such as visualizations, models and simulations are considered to be important for teaching and learning evolution. While the importance of visualizations is generally acknowledged for science education, less is known about how visual design can facilitate students understanding of threshold concepts, such as random mutations or spatial scales. This thesis uses the Model of Educational Reconstruction (MER) as the guiding framework for exploring the significance of threshold concepts by analysing the conceptual content of students' explanations and extant visualizations of natural selection. MER combines scientific content with teaching and learning perspectives for the analysis and design of learning environments. Content analysis of visualizations available online showed that most fail to fully represent the basic principles of natural selection (variation, selection and inheritance). Moreover, the representational potential of visualizations was seldom used to represent threshold concepts such as randomness in origin of variation. Visualizations were also biased to animals as the context of evolution. Similarly, upper-secondary and tertiary students' explanations of natural selection were seldom complete in terms of the basic principles and threshold concepts such as randomness were often lacking. Especially significant was the almost complete lack of randomness in upper-secondary students' explanations. In addition, threshold concepts were context-sensitive across the items used (bacteria, cheetah and salamander), for example spatial scale and randomness was significantly more common in responses to the bacteria item compared to the cheetah and salamander items. Considering the results from these studies, three interactive visualizations were developed (evolution of antibiotic resistance and fur colouration in mice). The visualization design was conducted iteratively following a Design-Based Research approach and evaluated in classroom settings in secondary and upper-secondary Swedish schools. The results showed that visualizations targeting randomness and genetic level events such as mutations can guide students towards a more scientific conception of natural selection. However, there were differences across the visualizations and student samples. In addition, while students often inferred randomness from the visuals, the results showed that integration of randomness into explanations of natural selection may be challenging. Hence, future research should explore the role of guidance and reflection for students understanding of randomness. The thesis also discusses the role of students' intuitive conceptions in relation to the use of interactive visualizations and how these preconceptions interact with the presented message. By using the theory of frame semantics, framing effects and conceptual integration, students' issues of achieving an accurate understanding of evolution are discussed in relation to the theory of conceptual change. Implications for teaching and learning natural selection as well as visualization design for learning are also discussed. Evolutionsteorin förs ofta fram som biologins förenande teori. Vikten av en korrekt och användbar evolutionsförståelse har därför ofta betonats, inte minst för elevers förståelse inom biologins olika delområden men också för att fatta beslut i samhällsfrågor som exempelvis antibiotikaresistens. Många av de centrala delarna av evolutionsteorin är kontraintuitiva eller abstrakta och decennier av forskning har visat att elever har svårigheter att förstå evolutionära processer som mutation och naturligt urval. Representationer såsom visualiseringar, modeller och simuleringar är därför viktiga för att ge elever direkta erfarenheter av evolutionära processer. Även om vikten av visualiseringar är allmänt accepterad inom naturvetenskapsundervisning så är det mindre känt hur visualiseringars utformning specifikt bidrar till att utveckla elevers förståelse av vetenskapliga fenomen såsom evolution. Dessutom har forskningen på elevers evolutionsförståelse till stor del fokuserat på så kallade nyckelbegrepp (variation, selektion och arv) som härletts från vetenskapliga beskrivningar av evolutionsteorin. Dessa begrepp antas vara nödvändiga men också tillräckliga för

elevers evolutionsförståelse. Dock har vikten av icke domänspecifika begrepp kopplade till evolutionsteorin, såsom slump, sannolikhet, spatial och temporala skalor (så kallade tröskelbegrepp), inte undersökts i någon högre grad. Den här avhandlingen använder Model of Educational Reconstruction för att utforska betydelsen av tröskelbegrepp för evolutionsförståelse. Med utgångspunkt i den vetenskapliga beskrivningen och historiken undersöks förekomsten av tröskelbegrepp i befintliga visualiseringar för lärande samt elevers förklaringar för att formulera designprinciper för interaktiva visualiseringar av evolution. Dessutom beskrivs utvecklingen av ett antal interaktiva visualiseringar samt undersökningar av deras potentiella användning i klassrumsmiljöer. Avhandlingen diskuterar även betydelsen av elevers intuitiva föreställningar i relation till användandet av interaktiva visualiseringar och hur dessa föreställningar interagerar med det presenterade budskapet. Genom användning av ramsemantisk teori inklusive "framingeffekter" och "blendteori" diskuteras elevers svårigheter och utveckling av en vetenskaplig evolutionsförståelse i relation till tidigare teorier om begreppsförändring. Konsekvenser av "ramsemantisk teori" och "framingeffekter" i visuella medier diskuteras även i relation till visuell design för lärande.

This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.

In the tradition of *Silent Spring* and *The Sixth Extinction*, an urgent, "disturbing, empowering, and essential" (Kirkus Reviews, starred review) book about the ways in which chemicals in the modern environment are changing—and endangering—human sexuality and fertility on the grandest scale, from renowned epidemiologist Shanna Swan. In 2017, author Shanna Swan and her team of researchers completed a major study. They found that over the past four decades, sperm levels among men in Western countries have dropped by more than 50 percent. They came to this conclusion after examining 185 studies involving close to 45,000 healthy men. The result sent shockwaves around the globe—but the story didn't end there. It turns out our sexual development is changing in broader ways, for both men and women and even other species, and that the modern world is on pace to become an infertile one. How and why could this happen? What is hijacking our fertility and our health? *Count Down* unpacks these questions, revealing what Swan and other researchers have learned about how both lifestyle and chemical exposures are affecting our fertility, sexual development—potentially including the increase in gender fluidity—and general health as a species. Engagingly explaining the science and repercussions of these worldwide threats and providing simple and practical guidelines for effectively avoiding chemical goods (from water bottles to shaving cream) both as individuals and societies, *Count Down* is "staggering in its findings" (Erin Brockovich, *The Guardian*) and "will serve as an awakening" (*The New York Times Book Review*).

*Biology of Termites, a Modern Synthesis* brings together the major advances in termite biology, phylogenetics, social evolution and biogeography. In this new volume, David Bignell, Yves Roisin and Nathan Lo have brought together leading experts on termite taxonomy, behaviour, genetics, caste differentiation, physiology, microbiology, mound architecture, biogeography and control. Very strong evolutionary and developmental themes run through the individual chapters, fed by new data streams from molecular sequencing, and for the first time it is possible to compare the social organisation of termites with that of the social Hymenoptera, focusing on caste determination, population genetics, cooperative behaviour, nest hygiene and symbioses with microorganisms. New chapters have been added on termite pheromones, termites as pests of agriculture and on destructive invasive species. **Bulletin No. 1-19 ...** U.S. Government Printing Office

Key Message: This book aims to explain physics in a readable and interesting manner that is accessible and clear, and to teach readers by anticipating their needs and difficulties without oversimplifying.

Physics is a description of reality, and thus each topic begins with concrete observations and experiences that readers can directly relate to. We then move on to the generalizations and more formal treatment of the topic. Not only does this make the material more interesting and easier to understand, but it is closer to the way physics is actually practiced.
