viii beginning to understand their action, as will be brought out in this symposium. During this same period another development took place in psychiatry, namely, social and community psychiatry, interpreted by some, incorrectly, in my opinion, as the antitheses of the biological approach. The whole area of the delivery of mental health services, which quickly became more of a political and social issue than a medical one, led to confusion, disillusionment, despair, and also soul-searching by psychiatrists and other mental health professionals. The remarkable Pablo Picasso said, "the development of photography freed the artist to express his own creativity." I have paraphrased Picasso's insightful remark, namely, "the development of biology and social and community psychiatry should free the psychiatrist to express his own creativity as a physician." It should allow him to regain his basic medical identity. As his medical identity becomes paramount, then the pejorative classification of psychiatrists into those "organically oriented" and those "dynamically-oriented" will no longer be valid. The psychiatrist, like his medical colleague, must be concerned with the psychological, psychosocial, biological, and technical aspects of psychiatry. The strengthening and development of the medical identity of the psychiatrist imposes increased responsibilities on him and on psychiatry as a medical discipline. On the one hand, he will have to become more of a neuro-biologist and, on the other, more of a behavioral scientist.

In ancient India, learning spanned four quarters of one's life. Learning was sought from the teacher, from one's individual effort, from fellow students and in the last quarter, from the school of life itself. This book belongs to the third quarter for students of Ayurveda regardless of their background in medicine, science, or humanities. Apart from topics in the eight branches of Ayurveda, the book also deals with Ayurvedic Biology which seeks to study the concepts and procedures of Ayurveda with the tools of modern biology.

Teacher's Wraparound Edition: Two Biology Everyday Experience Routledge

Knighting in sequence biology Edward N. Trifonov Genome classification, construction of phylogenetic trees, became today a major approach in studying evolutionary relatedness of various species in their vast diversity. Although the modern genome clustering delivers the trees which are very similar to those generated by classical means, and basic terminology is the same, the phenotypic traits and habitats are not anymore the playground for the classification. The sequence space is the playground now. The phenotypic traits are replaced by sequence characteristics, "words", in particular. Matter-of-factly, the phenotype and genotype merged, to confusion of both classical and modern phylogeneticists. Accordingly, a completely new vocabulary of stringology, information theory and applied mathematics took over. And a new brand of scientists emerged — those who do know the math and, simultaneously, (do?) know biology. The book is written by the authors of this new brand. There is no way to test their literacy in biology, as no biologist by training would even try to enter into the elite circle of those who masters their almost occult language. But the army of bioinformaticians, formal linguists, mathematicians humbly (or aggressively) longing to join modern biology, got an excellent introduction to the field of genome clustering, written by the team of their kin.

Biomedical advances have made it possible to identify and manipulate features of living organisms in useful ways—leading to improvements in public health, agriculture, and other areas. The globalization of scientific and technical expertise also means that many scientists and other individuals around the world are generating breakthroughs in the life sciences and related technologies. The risks posed by bioterrorism and the proliferation of biological weapons capabilities have increased concern about how the rapid advances in genetic engineering and biotechnology could enable the production of biological weapons with unique and unpredictable characteristics. Globalization, Biosecurity, and the Future of Life Sciences examines current trends and future objectives of research in public health, life sciences, and biomedical science that contain applications relevant to developments in biological weapons 5 to 10 years into the future and ways to anticipate, identify, and mitigate these dangers.

Bioinformatics, the use of computers to address biological questions, has become an essential tool in biological research. It is one of the critical keys needed to unlock the information encoded in the flood of data generated by genome, protein structure, transcriptome and proteome research. Bioinformatics: Genes, Proteins & Computers covers both the more traditional approaches to bioinformatics, including gene and protein sequence analysis and structure prediction, and more recent technologies such as datamining of transcriptomic and proteomic data to provide insights on cellular mechanisms and the causes of disease.

Recent decades have witnessed strong declines in fish stocks around the globe, amid growing concerns about the impact of fisheries on marine and freshwater biodiversity. Fisheries biologists and managers are therefore increasingly asking about aspects of ecology, behaviour, evolution and biodiversity that were traditionally studied by people working in very separate fields. This has highlighted the need to work more closely together, in order to help ensure future success both in management and conservation. The Handbook of Fish Biology and Fisheries has been written by an international team of scientists and practitioners, to provide an overview of the biology of freshwater and marine fish species together with the science that supports fisheries management and conservation. This volume, subtitled Fisheries, focuses on a wide range of topics, including the history of fisheries science, methods of capture, marketing, economics, major models used in stock assessments and forecasting, ecosystem impacts, marine protected areas and conservation. It builds on material in Volume 1, Fish Biology, which ranges from phylogenetics and biogeography to physiology, recruitment, life histories, genetics, foraging, reproductive behaviour and community ecology. Together, these books present the state of the art in our understanding of fish biology and fisheries and will serve as valuable references for undergraduates and graduates looking for a comprehensive source on a wide variety of topics in fisheries science. They will also be useful to researchers who need up-to-date reviews of topics that impinge on their fields, and decision makers who need to appreciate the scientific background for management and conservation of aquatic ecosystems. The first volume concentrates on aspects of fish biology and ecology, both at the individual and population levels, whilst the second volume addresses the assessment and management of fish populations and ecosystems. Written by an international team of expert scientists and practitioners. An invaluable reference tool for both students, researchers and practitioners working in the fields of fish biology and fisheries.
