Presents an introduction to modern NMR methods at a level suited to organic and inorganic chemists engaged in the solution of structural and mechanistic problems. The book assumes familiarity only with the simple use of proton and carbon spectra as sources of structural information and describes the advantages of pulse and Fourier transform spectroscopy which form the basis of all modern NMR experiments. Discussion of key experiments is illustrated by numerous examples of the solutions to real problems. The emphasis throughout is on the practical side of NMR and the book will be of great use to chemists engaged in both academic and industrial research who wish to realise the full possibilities of the new wave NMR.

In all the ancient spiritual texts water is depicted as the Source of all Creation from which everything else came into existence. All over the world, in our forefathers' traditions and rituals water is associated with the Primordial substance that has the power to heal, give us strength, and take away the sins. At the same time, modern scientific discoveries proved that our ancestors' beliefs, traditions, and rituals are a legacy and not some simple bet-time stories. Learn how your Emotions, Thoughts, and Intentions are influencing your Life, carried by the life-giving substance we call Water. “ This book covers a world of topics about water, from different religious texts, the chemistry and physics of H2O, studies over the past century on observations of fresh water, homeopathy, crystal structure, and different vibrations and forms of water, and back to religion. I learned so much. ” (Amazon customer review) “ A thorough, well-researched discussion of the significance of water--not only as a fundamental element of our biology and the structure of our planet and the universe--but also its metaphysical, philosophical, and theological importance historically and cross-culturally. ” (Amazon customer review)

Introductory Chemistry: An Active Learning Approach Cengage Learning

This dissertation is a cumulative doctoral work. It consists of six main chapters outlining five journal articles and a book chapter that discuss a literature review and four studies. The dissertation studies focus on the inclusion of indigenous knowledge (IK) in science and chemistry education to promote education for sustainable development (ESD). The first chapter analyses the general literature background and research framework of the study. This chapter presents an analytical literature review discussed in "A Multi-Perspective Reflection on How Indigenous Knowledge and Related Ideas Can Improve Science Education for Sustainability" (Zidny et al., 2020). It encompasses the theoretical framework, didactic model, educational research framework, and the educational values of the inclusion of IK in science and chemistry education. The second chapter outlines the research background of the Indonesian science curriculum and the current state of implementation of ESD in Indonesia. The significance of indigenous communities for this study is also presented with a special focus on the Baduy community in the Banten province, Java Island, Indonesia. The profile of the Baduy community is discussed in the book chapter "Indigenous Knowledge as a Socio-Cultural Context of Science to Promote Transformative Education for Sustainable Development: Insights into a Case Study on The Baduy Community (Indonesia) " (Zidny & Eilks, 2018) The third chapter presents four major studies that are part of research-based development of didactic teaching-learning-designs on the inclusion of IK and perspectives into science and chemistry education. The first study in this chapter (section 3.1) attempts to map out and explore indigenous, science-related knowledge from the Baduy community. From the findings, an educational analysis was conducted to identify contexts and content for science learning as well as for integrating indigenous science (ISc) into socioscientific issues-based education. This study is part of the book chapter by Zidny and Eilks (2018) and a paper entitled "Exploring Indigenous Science to Identify Contents and Contexts for Science Learning to Promote Education for Sustainable Development" (Zidny et al., 2021). The second study in chapter 3 (section 3.2) focuses on implementing a first teaching intervention on the integration of IK and Western modern science (WMSc) in chemistry education. The teaching intervention adopted model 3 of the ESD-based pedagogical approaches suggested by Burmeister et al. (2012) focusing on the controversial sustainability issue of pesticides use. The lesson was implemented in two groups on different educational levels, encompassing upper secondary school and university chemistry student teachers. The lesson's main activities start from the controversial issues of pesticides use to encourage learners to think critically, express their arguments, and solve chemistry problems in classroom task activities. Feedback from the learners about the lesson and the learning design was collected. This study is described in "Integrating perspectives from indigenous knowledge and Western science in secondary and higher chemistry learning to contribute to sustainability education" (Zidny & Eilks, 2020). The analysis and evaluation of the students' activities is discussed in the third study in chapter 3 (section 3.3). This study attempted to explore the initial level of students' arguments and their ability to link the context with chemistry concepts. Based on the findings, information from the analysis was used to evaluate and improve the learning design. This study is described in "A case study on students' application of chemical concepts and use of arguments in teaching on the sustainability-oriented chemistry issue of pesticides use under the inclusion of different scientific worldviews" (Zidny et al., 2021, under review a). The final study in chapter 3 (section 3.4) focuses on a second teaching intervention on the inclusion of ISc as a starting point to promote green and sustainable chemistry education. The teaching intervention adopted models 1 and 2 of ESD-based approaches suggested by Burmeister et al. (2012), namely adopting green chemistry lab practices and content. The lesson was implemented in an environmental chemistry course (elective course) with second-year undergraduate student teachers in Indonesia. This study is described in "Learning about phytochemical aspects of botanical pesticides adapted from ethnoscience as a contribution to green and sustainable chemistry education" (Zidny & Eilks, under review b) Chapter 5 summarizes all the studies in the research project and outlines the implication of the studies. In chapter 6, the published works of the thesis are presented.

A History of Modern Chemistry Elsevier

Based on the premise that many, if not most, reactions in organic chemistry can be explained by variations of fundamental acid-base concepts, Organic Chemistry: An Acid – Base Approach provides a framework for understanding the subject that goes beyond mere memorization. The individual steps in many important mechanisms rely on acid – base reactions, and the ability to see these relationships makes understanding organic chemistry easier. Using several techniques to develop a relational understanding, this textbook helps students fully grasp the essential concepts at the root of organic chemistry. Providing a practical learning experience with numerous opportunities for self-testing, the book contains: Checklists of what students need to know before they begin to study a topic Checklists of concepts to be fully understood before moving to the next subject area Homework problems directly tied to each concept at the end of each chapter Embedded problems with answers throughout the material Experimental details and mechanisms for key reactions The reactions and mechanisms contained in the book describe the most fundamental concepts that are used in industry, biological chemistry and biochemistry, molecular biology, and pharmacy. The concepts presented constitute the fundamental basis of life processes, making them critical to the study of medicine. Reflecting this emphasis, most chapters end with a brief section that describes biological applications for each concept. This text provides students with the skills to proceed to the next level of study, offering a fundamental understanding of acids and bases applied to organic transformations and organic molecules.

From New York Times bestselling author Sam Kean comes incredible stories of science, history, finance, mythology, the arts, medicine, and more, as told by the Periodic Table. Why did Gandhi hate iodine (I, 53)? How did radium (Ra, 88) nearly ruin Marie Curie's reputation? And why is gallium (Ga, 31) the go-to element for laboratory pranksters?* The Periodic Table is a crowning scientific achievement, but it's also a treasure trove of adventure, betrayal, and obsession. These fascinating tales follow every element on the table as they play out their parts in human history, and in the lives of the (frequently) mad scientists who discovered them. THE DISAPPEARING SPOON masterfully fuses science with the classic lore of invention, investigation, and discovery--from the Big Bang through the end of time. *Though

solid at room temperature, gallium is a moldable metal that melts at 84 degrees Fahrenheit. A classic science prank is to mold gallium spoons, serve them with tea, and watch guests recoil as their utensils disappear.

Ozonation in Organic chemistry, Volume I: Olefinic Compounds covers the historical background of ozone reactions with organic substances and the mechanisms of these reactions. Composed of 12 chapters, this book first deals with the development of the available theory of all ozone reactions, such as the Harries and Staudinger theories, particularly the Criegee mechanism of ozonolysis. This text then describes the step-by-step mechanism of the classical ozonolysis reaction of olefins and how it evolved. Considerable chapters are devoted to the reactions that compete with ozonolysis, such as epoxidation and other partial cleavage reactions. Both liquid- and gas-phase ozone reactions are explored in other chapters. This volume will appeal to those who are interested in exploring the frontiers of ozone-organic chemistry.

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand.We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

A blend of theory and practical advice, Modern NMR Techniques for Synthetic Chemistry illustrates how NMR spectroscopy can be used to determine the abundance, size, shape, and function of organic molecules. It provides you with a description the NMR technique used (more pictorial than mathematical), indicating the most common pulse sequences, some practical information as appropriate, followed by illustrative examples. This format is followed for each chapter so you can skip the more theoretical details if the practical aspects are what interest you. Following a discussion of basic parameters, the book describes the utility of NMR in detecting and quantifying dynamic processes, with particular emphasis on the usefulness of saturation-transfer (STD) techniques. It details pulsed – field gradient approaches to diffusion measurement, diffusion models, and approaches to ‘ inorganic ’ nuclei detection, important as many synthetic pathways to new organics involve heavier elements. The text concludes with coverage of applications of NMR to the analysis of complex mixtures, natural products, carbohydrates, and nucleic acids—all areas of activity for researchers working at the chemistry-life sciences interface. The book ’ s unique format provides some theoretical insight into the NMR technique used, indicating the most common pulse sequences. The book draws upon several NMR methods that are resurging or currently hot in the field and indicates the specific pulse sequence used by various spectrometer manufacturers for each technique. It examines the analysis of complex mixtures, a feature not found in most books on this topic.

The carbonyl group is undoubtedly one of the most important functional groups in organic chemistry, both in its role as reactive center for synthesis or derivatisation and as crucial feature for special structural or physiological properties. Vast and profound progress has been made in all aspects modern carbonyl chemistry. These achievements are, however, rather dispersed in the literature and it is often not easy for the researcher obtain a comprehensive overview of a relevant topic. Modern Carbonyl Chemistry overcomes this inconvenience by collating the information for appropriate themes. In this work internationally renowned experts and leaders in the field have surveyed recent aspects and modern features in carbonyl chemistry, such as cascade-reactions, one-pot-syntheses, recognition, or site differentiation.
