UNDERWATER INSPECTION AND REPAIR FOR OFFSHORE STRUCTURES

Benefit from a much-needed, up-to-date handbook on underwater inspection and repair processes and technologies

Underwater Inspection and Repair for Offshore Structures fills a gap in the literature to provide an overview of the inspection and repair processes for both steel and concrete offshore structures.

Authors and noted experts on the topic John V. Sharp and Gerhard Esdal guide readers through the reasons why inspection and repair are performed and how both are linked to the management of structural

integrity, statutory requirements, and various types of damage. The book addresses critical topics, including the execution and planning of inspection and repair, the tools and methods used, and their deployment underwater. The authors put particular focus on steel and concrete offshore oil and gas installations, but the content is also applicable to the substructures of offshore wind turbines. *Underwater Inspection and Repair for Offshore Structures* is complementary to the authors' book *Ageing and Life Extension of Offshore Structures*, also from Wiley. This important book: Covers current inspection and monitoring techniques to evaluate existing structures Includes coverage of robotic (ROV) inspection and repair methods Provides an

overview of repair and maintenance techniques applicable to the splash zone and underwater operations Written for engineers, designers, and safety auditors working with offshore structures. *Underwater Inspection and Repair for Offshore Structures* is a comprehensive resource for understanding how to effectively inspect and repair these vulnerable structures.

Underwater Inspection and Repair for Offshore Structures

During the early years of the Cold War, the most effective way to gather strategic intelligence about the Soviet Union and its allies was manned overflight. Lockheed's U-2 was spectacularly

successful in this role, however, much to the concern of US President Eisenhower, its shape meant that it could be tracked on Russian radars. Given the highly sensitive nature of such flights, the President insisted that every effort should be made to reduce to zero the U-2's radar cross section (RCS), thereby making the aircraft invisible. When this was proven to be impossible, the stage was set for a U-2 replacement. Following a competition between Lockheed and Convair, the former was declared the winner and the result was the A-12. Designed to incorporate 'stealth' features before the term was even coined, the A-12 has to date proven to be the fastest, highest flying jet aircraft ever built. This book will also cover a two-seat variation of the design built as an advanced interceptor – the YF-12.
