Molecular cell biology Elsevier
"Molecular Biology of the Cell" is the classic in-depth text reference in cell biology. By extracting the fundamental concepts and ever-growing field, the authors tell the story of cell biology, and create a coherent framework through which non-expert readers may approach the subject. Written in clear and concise language, and beautifully illustrated, the book is enjoyable to read, and it provides a clear sense of the excitement of modern biology. "Molecular Biology of the Cell" sets forth the current understanding of cell biology (completely updated as of Autumn 2001), and it explores the intriguing implications and possibilities of the great deal that remains unknown. The hallmark features of previous editions continue in the Fourth Edition. The book is designed with

a clean and open, single-column layout. The art program maintains a completely consistent format and style, and includes over 1,600 photographs, electron micrographs, and original drawings by the authors. Clear and concise concept headings introduce each section. Every chapter contains extensive references. Most important, every chapter has been subjected to a rigorous, collaborative revision process where, in addition to comments from expert reviewers, each co-author reads and reviews the other authors' prose. The result is a truly integrated work with a single authorial voice.

Freeman This is a completely revised and expanded edition of the Guidebook to Biochemistry. Every chapter has been reviewed and brought up to date. A new chapter, on the cell and membrane transport, has been included, and the single chapter on regulation in the previous edition has been greatly enlarged and divided into two

chapters. Other topics that have received particular attention in this edition include lipids, cell membranes and the biochemical action of hormones. The chapter on genetics has been revised to take account of recent studies of the genetic organization of higher organisms, and a section on genetic engineering has been included. In making these changes the authors have taken care to adhere to the concept of the 'Guidebook' introduced by Kenneth Harrison and maintained by them in the 1971 edition: to 'introduce the reader to the important features of the subject by exemplifying and discussing crucial biochemical concepts'. For this reason they have been careful to restrict the increase in the total length of the book compared with the 1971 edition.

The chapters in CYTOMETRY MCB volumes, including this 4th Edition, provide comprehensive description of particular cytometric methods and review their applications. Some chapters also describe new instrumentation and provide fundamental information on use of new fluorescent probes and on data analysis. Although the term "edition" suggests the update of earlier volumes, in fact, nearly all chapters of the 4th Edition are devoted to new topics.

The authors were invited to present not only technical protocols, such as available in other methodology books that specialize in the protocol format, but also to discuss the aspects of the methodology that generally are not included in the protocols. Many chapters, thus, present the theoretical foundations of the described methods, their applicability in experimental laboratory and clinical setting, common traps and pitfalls, problems with data interpretation, comparison with alternative assays, choice of the optimal assay, etc. Some chapters review applications of cytometry and complementary methodologies to particular biological problems or clinical tasks. Comprehensive presentation of cytometric methods covering theoretical applications, applicability, potential pitfalls, and comparisons to alternative assays. Discusses many new assays developed since the previous edition. Presents recent developments in

cytometric instrumentation/technology.
