Morse Test: Used for multi cylinder engines. Procedure: The engine is run at the required speed and the torque is measured. One cylinder is cut out by shorting the plug if an S.I. engine is under test. The speed falls because of the loss of power with one cylinder cut out but is restored by reducing the load.

An engine under mechanical efficiency test is connected to an electrical swinging- field dynamometer. The brake power reading was 24 kW at 1500 rev/min. On motoring test at the same engine speed the power reading was 6.07 kW. Calculate the indicated power and the mechanical efficiency. $P_i = P_b + P_f = 24 + 6.07 = 30.07$ (kW)

The Fairbanks-Morse 38 8-1/8 is a diesel engine of the two-stroke, opposed-piston type. It was developed in the 1930s, and is similar in arrangement to a contemporary series of German Junkers aircraft diesels. The engine was used extensively in US diesel electric submarines of the 1940s and 1950s, as backup power on

most US nuclear submarines, as well as in other marine applications, stationary power generation, and briefly, locomotives. A slightly modified version, the 38ND 8-1/8, continues in
