Nutrition is becoming an explosive area of research. The author, Professor Emeritus, has

studied this important subject and its relation to the eye for over 40 years. Ocular tissue consists of neural cells, epithelial and endothelial cells, muscle cells, connective tissues, secretory gland cells, skin, mucous cells, etc. Thus studies of the nutritional aspect of ocular tissues may provide clues to the significance of the nutrients common to all organs. Since morphological studies of nutrients are scarce, this volume may contribute to the understanding of nutrients in all organs. This new book covers the conjunctiva, cornea, retina, optic nerve, and sometimes rectus muscles related to nutrition and will serve as a key reference in the field

An examination of why paper continues to fill our offices and a proposal for better coordination of the paper and digital worlds. Over the past thirty years, many people have proclaimed the imminent arrival of the paperless office. Yet even the World Wide Web, which allows almost any computer to read and display another computer's documents, has increased the amount of printing done. The use of e-mail in an organization causes an average 40 percent increase in paper consumption. In *The Myth of the Paperless Office*, Abigail Sellen and Richard Harper use the study of paper as a way to understand the work that people do and the reasons they do it the way they do. Using the tools of ethnography and cognitive psychology, they look at paper use from the level of the individual up to that of organizational

culture. Central to Sellen and Harper's investigation is the concept of "affordances"—the activities that an object allows, or affords. The physical properties of paper (its being thin, light, porous, opaque, and flexible) afford the human actions of grasping, carrying, folding, writing, and so on. The concept of affordance allows them to compare the affordances of paper with those of existing digital devices. They can then ask what kinds of devices or systems would make new kinds of activities possible or better support current activities. The authors argue that paper will continue to play an important role in office life. Rather than pursue the ideal of the paperless office, we should work toward a future in which paper and electronic document tools work in concert and organizational processes make optimal use of both.

Previously published as Strategic Information Management in Hospitals; An Introduction to Hospital Information Systems, Health Information Systems Architectures and Strategies is a definitive volume written by four authoritative voices in medical informatics. Illustrating the importance of hospital information management in delivering high quality health care at the lowest possible cost, this book provides the essential resources needed by the medical informatics specialist to understand and successfully manage the complex nature of hospital information systems. Author of the first edition's Foreword, Reed M. Gardner, PhD, Professor and Chair, Department of Medical Informatics, University of Utah and LDS Hospital, Salt Lake City, Utah, applauded the text's focus on the underlying administrative systems that are in place in hospitals throughout the world. He wrote, "These challenging systems that acquire, process and manage the patient's clinical information. Hospital information systems provide a major part of the information needed by those paying for health care." their components; health information systems; architectures of hospital information systems; and organizational structures for information management.

Ophthalmic Toxicology Cq Communications

Each year the improvements in communication and transportation, the growing awareness that the resources of this earth are finite, the realization that the population explosion in any part of the world is a concern of all, and the increased economic interdependence of all countries, have increased importance of internationalism as opposed to nationalism. One of the first segments of our society to ignore political and geographic boundaries was that of medicine, particularly in the field of communicable diseases. Valient efforts have been made by some individuals at great personal sacrifice and by individual societies or organizations to prevent and cure blindness and to rehabilitate those who have lost their sight. Only recently, however, have such efforts been consolidated into a major international force. In 1969 the 22nd World Health Assembly of WHO adapted a resolution requesting the Director-General to undertake a study on the information which is at pre sent available on the extent and/or causes of preventable and curable blind ness. In 1972 a working group was convened by the World Health Organiza tion in Geneva to outline an attack on the prevention of blindness. At the Paris meeting of the International Congress of Ophthalmology in July of 1974,

Mr. JOHN WILSON, who for many years had been one of the leaders in the prevention and cure of blindness on an international basis through his organization of the Royal Commonwealth Society for the Blind, was elected President of the International Association for Prevention of Blindness.
