The development of generic skills (often referred to as 'soft skills') in accounting education has been a focus of discussion and debate for several decades. During this time employers and professional bodies have urged accounting educators to consider and develop curricula which provide for the development and assessment of these skills. In addition, there has been criticism of the quality of accounting graduates and their ability to operate effectively in a global economy. Embedding generic skills in the accounting curriculum has been acknowledged as an appropriate means of addressing the need to provide 'knowledge professionals' to meet the needs of a global business environment. Personal Transferable Skills in Accounting Education illustrates how generic skills are being embedded and evaluated in the accounting curriculum by academics from a range of perspectives. Each chapter provides an account of how the challenge of incorporating generic skills in the accounting curriculum within particular educational environments has been addressed. The challenges involved in generic skills development in higher education have not

been limited to the accounting discipline. This book provides examples which potentially inform a wide range of discipline areas. Academics will benefit from reading the experiences of incorporating generic skills in the accounting curriculum from across the globe. This book was originally published as a themed issue of Accounting Education: an international journal.

Fundamentals of Information Technology for Class IX (Based on MS Office) (Code 402) (A.Y. 2023-24) Onward IGI Global During recent decades we have witnessed not only the introduction of automation into the work environment but we have also seen a dramatic change in how automation has influenced the conditions of work.

While some 30 years ago the addition of a computer was considered only for routine and boring tasks in support of humans, the balance has dramatically shifted to the computer being able to perform almost any task the human is willing to delegate. The very fast pace of change in processor and information technology has been the main driving force behind this development.

Advances in automation and especially Artificial Intelligence (AI) have enabled the formation of a rather unique team with human and electronic members. The team is still supervised by the human with the machine as a subordinate associate or assistant, sharing responsibility, authority and autonomy over many tasks. The requirement for teaming human and machine in a highly dynamic and unpredictable task environment has led to impressive achievements in many supporting technologies. These include methods for system analysis, design and engineering and in particular for information processing, for cognitive and complex knowledge [1] engineering .

there is a disconnect between the amazing technology of powerpoint and a mediocre student learning experience. To unleash the full potential of powerpoint presentations, we must do a better job of creating presentations that fit the educational needs of students. Slides for Students does just that. Slides for Students is an open and honest discussion about powerpoint in the classroom. A need exists for thoughtfully designed and implemented classroom instruction that focuses on the learner rather than on the technology. This book was written to translate academic research findings into practical suggestions about powerpoint that educators can use. Divided into two parts, Slides for Students discusses the history of powerpoint, explores academic studies on the topic, and demonstrates how to design slides to best suit educational needs and engage with students to avoid the dreaded "death by powerpoint."
