Multivariable control system. In contrast to an open-loop control system, a closed-loop control system utilizes an additional measure of the actual output to compare the actual output with the desired output response. The measure of the output is called the feedback signal. A simple closed-loop feedback control system is shown in Figure 1.3. A feedback con-

Control engineering education. In others, control engineering is connected to computer science, as most control techniques today are implemented through computers, often as embedded systems (as in the automotive field). The field of control within chemical engineering is often known as process control.

Multivariable Control Systems focuses on control design with continual references to the practical aspects of implementation. While the concepts of multivariable control are justified, the book emphasises the need to maintain student interest and motivation over exhaustively rigorous mathematical proof.

Multivariable control is a technique that allows us to deal with more than one control objective at the same time. For a particular piece of equipment or a process unit, two or more variables, so-called controlled variables (Cs) must be kept at their target values, their setpoints.

The term "model-based multivariable control" has been so ubiquitous for so long that many engineers don't realize they can have multivariable control without all the work of models. Rather than being the latest twist in multivariable control, model-less multivariable control (XMC) represents a return to basics.
