Ecologically Based Pest Management
Independently Published
Widespread use of broad-spectrum
chemical pesticides has revolutionized
pest management. But there is
growing concern about environmental
contamination and human health
risks--and continuing frustration over

the ability of pests to develop
resistance to pesticides. In
Ecologically Based Pest Management,
an expert committee advocates the
sweeping adoption of ecologically
based pest management (EBPM) that
promotes both agricultural productivity
and a balanced ecosystem. This
volume offers a vision and strategies
for creating a solid, comprehensive
knowledge base to support a pest
management system that incorporates
ecosystem processes supplemented by
a continuum of inputs--biological
organisms, products, cultivars, and
cultural controls. The result will be
safe, profitable, and durable pest

management strategies. The book
evaluates the feasibility of EBPM and
examines how best to move beyond
optimal examples into the mainstream
of agriculture. The committee stresses
the need for information, identifies
research priorities in the biological as
well as socioeconomic realm, and
suggests institutional structures for a
multidisciplinary research effort.
Ecologically Based Pest Management
addresses risk assessment, risk
management, and public oversight of
EBPM. The volume also overviews the
history of pest management--from the
use of sulfur compounds in 1000 B.C.
to the emergence of transgenic

technology. Ecologically Based Pest Management will be vitally important to the agrichemical industry; policymakers, regulators, and scientists in agriculture and forestry; biologists, researchers, and environmental advocates; and interested growers.

There are four areas to consider related to control of garden pests. Prevention Pest Management Weed Management Disease Management Though related, these areas need their own attention and procedures for control. This book focuses on Pest Management. Organic gardening relies primarily on biological and cultural practices to manage pests, weeds, and diseases, but thinking that organic gardening means vegetables free of any chemical pesticides is not quite right. Organic pesticides are derived from naturally occurring substances. They need to be extracted, processed or concentrated from the natural source, but they are generally not chemically changed. In contrast, "synthetic" pesticides are usually derived from petroleum sources and the chemistry of the molecules is changed to give a desired product. Why are organic pesticides preferred by some gardeners? They breakdown rapidly in the environment after application, they act to prevent further insect feeding and many have a low toxicity to people and animals. Organic gardeners can use certain pesticides -- chemicals that are derived from botanical and

mineral-bearing sources. These chemicals break down more rapidly than common synthetic chemicals. Long term natural pest control is the most cost effective approach to managing insect pests. This method provides stable, continuous suppression of pests by promoting their natural enemies. The long term approach is also the least toxic method of controlling insects. Chemicals are normally not needed and should be used only as a last resort. Pesticides Permitted in Organic Gardening As a general rule, most pesticides are prohibited for organic production. The use of botanical and mineral-bearing pesticides can also be incorporated into an Integrated Pest Management (IPM) approach to growing crops. IPM relies on a variety of pest control means rather than on one product or method. The pesticides discussed in this book are appropriate to include in IPM programs. Organic pesticides fall into five broad groups: Botanical Microbial Mineral Household Remedies Plant Barriers and Insect Traps Botanical pesticides are obtained from the roots, leaves, seeds, stems or flowers of plants. Many plants manufacture chemical compounds that protect them from pest attack. Once identified, people began using these chemicals to protect valued plants against similar pests. Microbial pesticides contain pathogenic bacteria, viruses, fungi or

nematodes. These microorganisms serve as natural enemies to some insects and control natural population outbreaks under certain conditions. Manufacturing processes have allowed the application of these microbial pesticides in the form of sprays, dusts, baits or granules to control pest outbreaks. Mineral-based pesticides are derived from inorganic chemicals. They are crystalline, stable chemicals that do not evaporate but generally dissolve easily in water. Household remedies center around repurposing various detergents and chemicals used around the house for pest control. Plant barriers, companion planting and insect traps constitute the fifth tool for organic gardening and control of pests.

This book is an update on environmentally sound pest management practices under the umbrella of integrated pest management (IPM). It consists of seven contributions from different authors providing information on pest management approaches as chemical alternatives. The book chapters detail about historical review of IPM concepts; strategies and some experiences in applications of IPM in Latin America; pest control in organic agricultural system; and the use of entomopathogenic and molluscoparasitic nematodes, insect pheromones, semiochemicals, detergents, and soaps as a part of IPM scheme. The goal of this book is to provide the most up-to-date review on information available around chemical alternatives in

IPM. Therefore, this book will equip academia and industry with adequate basic concepts and applications of IPM as eco-friendly pest management option.
