Pests are an inevitable part of our existence. Without our knowledge we coexist with several kinds of pests may it be through our pets, our plants even in the security of our own homes. It also comes in different sizes and forms but as microscopic or minute, though visible to the human eye, they appear they create a vast nuisance to our daily lives. With nature's law of cause and effect, humans, in defense to these pests, find ways to control it in the hopes of finally eradicating the pests' existence. We want to get rid of those pests as fast as we can without taking in consideration what makes these products very powerful that it can do what it says it will do. In return, these pests can develop an adaptation mechanism that makes them immune to these commercial products. As a result, we buy another brand or use a different approach that may contain stronger chemical components.

The UN's Food and Agriculture Organization defines integrated pest management (IPM) as "the careful consideration of all available pest control techniques and subsequent integration of appropriate measures that discourage the development of pest populations and keep pesticides and other interventions to levels that are economically justified and reduce or minimize risks to human health and the environment. IPM emphasizes the growth of a healthy crop with the least possible disruption to agroecosystems and encourages natural pest control mechanisms." Although this is a concept championed since the 70s, recent advances in agricultural biotechnologies and unfortunately, new problems brought on by global climate change warrant a reevaluation of how IPM can be implemented. This book aims at bringing out a comprehensive collection of information on all aspects of advances in integrated pest management technology in agriculture systems worldwide. The main focus of this book is to address the nano-biotechnology as sustainable solutions, biogenetic insect resistant plants in integrated pest management technology (IPMT), and DNA barcoding of insects and role of protease inhibitors in recent management trends. It also highlights the advances in integrated management of insect pests of stored grains, and use of bee pollinator's as a livelihood security to the people worldwide. Step-by-step descriptions, accompanied by numerous photographs and schematic

drawings, are provided on IPMT under changing climate, and habitat manipulation in crops. This book thus provides a forward-looking foundation for IPMT systems and its use in crop production.

Widespread use of broad-spectrum chemical pesticides has revolutionized pest management. But there is growing concern about environmental contamination and human health risks--and continuing frustration over the ability of pests to develop resistance to pesticides. In Ecologically Based Pest Management, an expert committee advocates the sweeping adoption of ecologically based pest management (EBPM) that promotes both agricultural productivity and a balanced ecosystem. This volume offers a vision and strategies for creating a solid, comprehensive knowledge base to support a pest management system that incorporates ecosystem processes supplemented by a continuum of inputs--biological organisms, products, cultivars, and cultural controls. The result will be safe, profitable, and durable pest management strategies. The book evaluates the feasibility of EBPM and examines how best to move beyond optimal examples into the mainstream of agriculture. The committee stresses the need for information, identifies research priorities in the biological as well as socioeconomic realm, and suggests institutional structures for a multidisciplinary research effort. Ecologically Based Pest Management addresses risk assessment, risk management, and public oversight of EBPM. The volume also overviews the history of pest management--from the use of sulfur compounds in 1000 B.C. to the emergence of transgenic technology. Ecologically Based Pest Management will be vitally important to the agricultural industry; policymakers, regulators, and scientists in agriculture and forestry; biologists, researchers, and environmental advocates; and interested growers.
