Control of Insect Behavior by Natural Products presents papers on new biochemical approaches to pest control. The book presents articles on pheromone research with stored-product Coleoptera; some general considerations of insects responses to the chemicals in food plants; and pheromones of the honey bee. The text also includes papers on several substances responsible for the feeding behavior and growth of the silkworm larva; the sensory responses of Phytophagus lepidoptera to chemical and tactile stimuli; and the use of volatile organic sulfur compounds as insect attractants with special reference to host selection. Insect anti-feedants in plants; a house fly attractant in the mushroom; and studies on sex pheromones of the stored grain moths are also considered. The book also demonstrates articles on the electrophysiological investigation of insect olfaction; and host attractants for the rice weevil and the cheese mite. Entomologists, biologists, chemists, and people involved in the research of pest control will find the book invaluable.

Chemical pesticides have many disadvantages. Although they remove the pest, they also kill many of the insects that are useful to the crop, can pollute soil and water supplies, and make people sick. The benefits of chemical pesticides decrease over time as pests become resistant to them. This means that the pesticide kills the weaker pests, leaving the strongest to breed a new generation which is immune to the pesticide.
