Gardening can be a political act. Creativity, fulfillment, connection, revolution--it all begins when we get our hands in the dirt. Food Not Lawns combines practical wisdom on ecological design and community-building with a fresh, green perspective on an age-old subject. Activist and urban gardener Heather Flores shares her nine-step permaculture design to help farmsteaders and city dwellers alike build fertile soil, promote biodiversity, and increase natural habitat in their own "paradise gardens." But Food Not Lawns doesn't begin and end in the seed bed. This joyful permaculture lifestyle manual inspires readers to apply the principles of the paradise garden--simplicity, resourcefulness, creativity, mindfulness, and community--to all aspects of life. Plant "guerilla gardens" in barren intersections and medians; organize community meals; start a street theater troupe or host a local art swap; free your kitchen from refrigeration and enjoy truly fresh, nourishing foods from your own plot of land; work with children to create garden play spaces. Flores cares passionately about the damaged state of our environment and the ills of our throwaway society. In Food Not Lawns, she shows us how to reclaim the earth one garden at a time.

Organic Pest Control the Practical Guide St Lynns Press

The UN's Food and Agriculture Organization defines integrated pest management (IPM) as "the careful consideration of all available pest control techniques and subsequent integration of appropriate measures that discourage the development of pest populations and keep pesticides and other interventions to levels

that are economically justified and reduce or minimize risks to human health and the environment. IPM emphasizes the growth of a healthy crop with the least possible disruption to agro-ecosystems and encourages natural pest control mechanisms. "Although this is a concept championed since the 70s, recent advances in agricultural biotechnologies and unfortunately, new problems brought on by global climate change warrant a reevaluation of how IPM can be implemented. This book aims at bringing out a comprehensive collection of information on all aspects of advances in integrated pest management technology in agriculture systems worldwide. The main focus of this book is to address the nano-biotechnology as sustainable solutions, biogenetic insect resistant plants in integrated pest management technology (IPMT), and DNA barcoding of insects and role of protease inhibitors in recent management trends. It also highlights the advances in integrated management of insect pests of stored grains, and use of bee pollinator's as a livelihood security to the people worldwide. Step-by-step descriptions, accompanied by numerous photographs and schematic drawings, are provided on IPMT under changing climate, and habitat manipulation in crops. This book thus provides a forward-looking foundation for IPMT systems and its use in crop production.
