The second edition of Gas Chromatography and Mass Spectrometry: A Practical Guide follows the highly successful first edition by F.G. Kitson, B.S. Larsen, and C.N. McEwen (1996), which was designed as an indispensable resource for GC/MS practitioners regardless of whether they are a novice or well experienced. The Fundamentals section has been extensively reworked from the original edition to give more depth of an understanding of the techniques and science involved with GC/MS. Even with this expansion, the original brevity and simple didactic style has been retained. Information on chromatographic peak deconvolution has been added along with a more in-depth understanding of the use of mass spectral databases in the identification of unknowns. Since the last edition, a number of advances in GC inlet systems and sample introduction techniques have occurred, and they are included in the new edition. Other updates include a discussion on fast GC and options for combining GC detectors with mass spectrometry. The section regarding GC Conditions, Derivatization, and Mass Spectral Interpretation of Specific Compound Types has the same number of compound types as the original edition, but the information in each section has been expanded to not only explain some of the spectra but to also explain why certain fragmentations take place. The number of Appendices has been increased from 12 to 17. The Appendix on Atomic Masses and Isotope Abundances has been expanded to provide tools to aid in determination of elemental composition from isotope peak intensity ratios. An appendix with examples on "Steps to follow in the determination of elemental compositions based on isotope peak intensities" has been added. Appendices on whether to use GC/MS or LC/MS, third-party software for use in data analysis, list of information required in reporting GC/MS data, X+1 and X+2 peak relative intensities based on the number of atoms of carbon in an ion, and list of available EI mass spectral databases have been added. Others such as the ones on derivatization, isotope peak patterns for ions with Cl and/or Br, terms used in GC and in mass spectrometry, and tips on setting up, maintaining and troubleshooting a GC/MS system have all been expanded and updated. Covers the practical instruction necessary for successful operation of GC/MS equipment Reviews the latest advances in instrumentation, ionization methods, and quantitation Includes troubleshooting techniques and a variety of additional information useful for the GC/MS practitioner A true benchtop reference A guide to a basic understanding of the components of a Gas Chromatograph-Mass Spectrometer (GC-MS) Quick References to data interpretation Ready source for information on new analyses

The concept for this book evolved over many years of intense clinical practice during which a wide variety of vascular complications were encountered as a result of other surgical or interventional procedures. In this book, the authors describe cohesive efforts by experts in the field as they commit to advancing health care quality by all professionals. It should be noted at the outset that the book does not discuss various non-vascular or systemic complications of patients undergoing vascular interventions such as myocardial infarction, renal or respiratory failure. Instead, the content is divided into four separate sections. The material begins with an introduction to vascular anatomy and function. There follows a section addressing specific complications of the vascular system that can occur in any patient, sometimes even without intervention. The third section addresses complications specific to interventions and surgical procedures. The final section is dedicated to the delayed and long-term sequelae attributable to the most commonly encountered vascular complications. Vascular Complications of Surgery and Intervention: A Practical Guide is targeted towards dedicated health care professionals managing patients affected by inadvertent but potentially disastrous vascular complications and for those practitioners performing interventions either directly upon the vascular system or procedures that have potential for collateral impact.
