Questions & Answers on Nervous System Related Disorders CHANGDER OUTLINE Neuroscience is a discipline rich in data. In neuroscience, information about the nervous system is derived using a wide-range of experimental methodologies. While each of these methodologies can provide unique insight into nervous system function, each of them are also fundamentally tied to the subjects they measure. Because of this, no single experimental methodology can provide a universal perspective on nervous system function. It becomes sensible, therefore, to explore how we might gain greater insight into the nervous system from unifying the data derived from different experimental methodologies. In this dissertation, I apply techniques from computer science to assemble the rich sets of data in neuroscience into data structures that allow otherwise impractical or impossible questions to be answered. Because of the nature of the nervous system, these data structures must be capable of dealing with data describing parts of the nervous system that vary in size across eight orders of magnitude, otherwise known as "multi-scale" data. These parts include molecules, parts of cells, cells and their circuits, brain regions and features of gross anatomy. In order to address this challenge, I distinguish between information about the nervous system that expresses facts or semantic relationships (the "what"), from information that expresses images or spatial information (the "where"). I apply a data structure known as an ontology to describe parts of cells relevant to neuroscience, i.e. subcellular anatomy. This ontology is applied to enable automated question answering, i.e. inference, from data sets displaying parts of cells that are derived from electron microscopy. The challenges of building these data structures as a neuroscience community are reviewed, and in response I present an online software system, NeuroLex.org, that provides a first step towards addressing them. Additional examples of automated question answering in neuroanatomy are shown using the NeuroLex knowledge base, which now spans ~17,000 concepts specific to neuroscience. To address the challenge of the "where" of neuroscience, I present an online software system, the Whole Brain Catalog, that enables two-dimensional, three-dimensional, and four-dimensional (i.e. time-varying) multi-scale data sets to be spatially integrated within a common coordinate system. These data are then navigable by a user in three dimensions in real time and across spatial scales, and can be integrated to answer scientific questions. The dissertation concludes with a look towards the future of the continued convergence between computer science and neuroscience. There are many health disorders that are related to the functioning of the nervous system, which is comprised of sensory, motor and autonomic nerves. The “ Involuntary Nervous System ” , is especially vulnerable to imbalances within it that can occur due to hormone imbalances, vitamin deficiencies, emotional and mental disorders and nervous system, spinal cord and brain abnormalities. Within this approximately 24,000 word e-book, I have compiled a number of responses I made to fellow patients, experiencing nervous system related health disorders, such as peripheral neuropathies, myopathies (neuromuscular problems) and nervous system diseases. These responses, which are presented as well-informed layperson opinions in Q & A form, include my personal experiences with nervous system symptoms as related to my thyroid disease, peripheral neuropathies, myopathy, Mitral Valve Prolapse Syndrome and vitamin deficiency diagnoses.

An important aspect of online symptom searches that I mention in several opinions I include in this e-book is on the subject of “ cyberchondria ” (also called “ surf diagnosis induced anxiety ”) , a serious anxiety reaction that can occur in patients who do not understand the importance of balanced medical searches, on reputable online sources. It is my hope that these 77 short, individual opinion-posts (averaging 300 words each) will prove to be interesting and beneficial to the readers of them.

SECTIONS:SECTION ONE: Questions and Answers/Opinions 1 through 20SECTION TWO: Questions and Answers/Opinions 21 through 40SECTION THREE: Questions and Answers/Opinions 41 through 60SECTION FOUR: Questions and Answers/Opinions 61 through 77(

Note: Proper diagnosis and treatments for health disorders of any kind must always be obtained through qualified, medical professionals.)

Experience Autonomic nervous system. The 'autonomic anxious system' ('ANS' either 'visceral anxious system' either 'involuntary anxious system') is the part of the accessory anxious configuration that acts as a command configuration that purposes mostly beneath the layer of awareness to command instinctive purposes, containing heart charge, ingestion, breathing charge, spittleing, sweat, pupillary dilatation, urination (urination), intimate rousing, inhaling and exhaling and swallowing. Most independent purposes are spontaneous however they may frequently work in combination with the animal anxious configuration that delivers discretionary command. There has never been a Autonomic nervous system Guide like this. It contains 248 answers, much more than you can imagine; comprehensive answers and extensive details and references, with insights that have never before been offered in print. Get the information you need--fast! This all-embracing guide offers a thorough view of key knowledge and detailed insight. This Guide introduces what you want to know about Autonomic nervous system.
