The Human Nervous System is the soft tissue conduit within our body in which signals from the brain travel to various parts of the body to perform specific functions. Some of these functions may be automatic, such as breathing and others may be by the express intent of the individual, such as typing on the computer. A chart showing the body's nervous system would help explain how signals are sent from the brain to various parts of the body.

This Study Guide is uniquely designed to complement current introductory textbooks and online courses in speech and hearing anatomy and physiology. Whether taught face-to-face or online, anatomy and physiology courses and their accompanying texts are dense in content. This workbook answers the need for a practical book, being neither unnecessarily complex nor academic, for undergraduate training in speech-language pathology. It is designed to allow students to work at their own pace, to learn how to organize, how to bring together, and how to functionally apply the content learned in their coursework. The Study Guide is organized into seven units. The first unit contains a comprehensive synopsis of anatomy and physiology, including content such as locator terms, planes of reference, and anatomical position, enabling students to learn the vocabulary needed to study anatomy and physiology. The second unit takes a brief look at the basics of cells and tissues to form a foundation for study of larger structures. The remainder of the workbook organizes speech and hearing anatomy into the functional categories of respiration, phonation, articulation, as well as the nervous and auditory systems. Each unit provides an extremely well-written, practical summary of the particular speech and hearing system, followed by learning objectives, specific questions students can answer in outline format, and finally, a self-test. This all-new Study Guide clarifies and simplifies a complex element of the introductory course and provides an ideal complementary learning and self-testing tool for students. To complement the workbook, the Instructor's Manual includes the answers to the workbook questions, and is available in both print and digital format. Course instructors will find this much-needed guide an essential tool for clarifying complex issues, presenting material in simple, graphic form, and structuring coursework.

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet

the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom.
