This book gives an alternative approach to quantitative analysis computations in chemistry. The alternative approach used in this book to solve various quantitative analysis problems is named formula method. Titration formulae for various titrations have been derived in this book. The six main titration formulae derived are: (i). The new titration formula for all acid-base titrations(ii). Titration formula for all acid-carbonate titrations (iii). Titration formula for acid-borax titrations.(iv). Titration formula for Potassium Permanganate-Ferrous Ammonium Sulphate titrations(v). Titration formula for Potassium Permanganate against oxalic acid or arsenious acid titrations. (vi). Titration formula

for Potassium Dichromate-Ferrous Ammonium Sulphate titrations. The new titration formula for all acid-base titrations is further used to derive the following volumetric analysis formulae:(i). Formula that relates reacting volumes and concentrations of any two acids reacted separately with equal volumes of a basic solution of the same concentration.(ii). Formula that relates reacting volumes and concentrations of any two different basic solutions reacted separately with equal volumes of an acidic solution of the same concentration.(iii). Formula that relates volumes and concentrations of any two acids reacted separately with different volumes of a basic solution of the same concentration.(iv). Formula that relates volumes and concentrations of any two bases reacted separately with different volumes of an acidic solution of the same concentration.(v). Formula that relates volumes and concentrations of any two acids separately involved in complete neutralization reactions with equal volumes of basic solutions of the same substance, where the molarity of the basic solutions are different.(vi). Formula that relates volumes and concentrations of any two bases separately involved in complete neutralization reactions with equal volumes of acidic solutions of the same substance, where the molarity of the acidic solutions are different.The new titration formula for all acid-base titrations and the titration formula for all acid-carbonate titrations have also been used to derive a formula that relates reacting volumes and concentrations of a carbonate solution and a basic solution

when reacted with equal volumes of the same acid. Stoichiometric mathematical expressions have been derived which equate moles/amounts of reactants and products to each other for the following groups of chemical reactions discussed in this book: (a). Neutralization reactions. (b). Acid-carbonate and acid-hydrogen carbonate reactions. (c). Reactions of acids with metals. (d). Reactions of acids with ammonia. (e). Double and single displacement reactions. (f). Reactions of metals with sulphur and phosphorous. (g). Reactions of diatomic gases with metals. (h). Reactions between hydrogen and other diatomic gases. (i). Reactions between oxygen and group IV elements (e.g., C), group V elements (e.g., P) and group VI elements (e.g., S). (j). Reaction of oxygen with gaseous oxides (i.e., CO, NO and SO<sub>2</sub>). (k). reactions of metal hydrides with water. The titration formulae and stoichiometric mathematical expressions that equate moles/amounts of reactants and products to each other are easy to remember and apply. Some examples have been given on how to apply the formulae derived to get to the right answer through fewer steps. Examples have also been given on how to use stoichiometric mathematical expressions that equate moles of reactants and products to each other to algebraically balance chemical equations.
