Acute and Chronic Wounds - E-Book BoD – Books on Demand

This open access book aims to provide a comprehensive but practical overview of the knowledge required for the assessment and management of the older adult with or at risk of fragility fracture. It considers this from the perspectives of all of the settings in which this group of patients receive nursing care. Globally, a fragility fracture is estimated to occur every 3 seconds. This amounts to 25 000 fractures per day or 9 million per year. The financial costs are reported to be: 32 billion EUR per year in Europe and 20 billion USD in the United States. As the population of China ages, the cost of hip fracture care there is likely to reach 1.25 billion USD by 2020 and 265 billion by 2050 (International Osteoporosis Foundation 2016). Consequently, the need for nursing for patients with fragility fracture across the world is immense. Fragility fracture is one of the foremost challenges for health care providers, and the impact of each one of those expected 9 million hip fractures is significant pain, disability, reduced quality of life, loss of independence and decreased life expectancy. There is a need for coordinated, multi-disciplinary models of care for secondary fracture prevention based on the

increasing evidence that such models make a difference. There is also a need to promote and facilitate high quality, evidence-based effective care to those who suffer a fragility fracture with a focus on the best outcomes for recovery, rehabilitation and secondary prevention of further fracture. The care community has to understand better the experience of fragility fracture from the perspective of the patient so that direct improvements in care can be based on the perspectives of the users. This book supports these needs by providing a comprehensive approach to nursing practice in fragility fracture care.

Lower limb wounds are frequently observed in clinical practice and often present a real challenge for health care practitioners. Lower extremity wound care requires a multidisciplinary approach involving a number of different health care professionals in order to achieve optimum patient care. Nurses and podiatrists, in particular, are frequently involved in the assessment and management of lower extremity wounds, often working in partnership. Lower Extremity Wounds: A problem-based learning approach is the first wound care book that has been written as a joint venture by experienced nurses and podiatrists, all

with expert knowledge in wound care. It highlights the importance of multi-professional collaboration to encourage the crossing and dismantling of professional boundaries, to increase understanding of each other's roles, and ultimately to ensure that the patient receives the best available evidence-based interventions during their health care journey. Taking a problem-based learning approach, each of the ten chapters highlights best practice in the management of wounds by type, discusses clinical guidelines and current evidence, and links this theory to a clinical scenario thus bridging the theory to practice gap. Numerous full-colour illustrations are used throughout the book to visually enhance the reader's learning. Aimed at both students and practitioners, this book is essential reading for anyone involved in lower extremity wound care.
