This book presents a debate between "reasonable" educators who either claim that there is evidence for the effectiveness of whole

language, or who challenge the claim that whole language works across the broad spectrum of learners. The book presents the debate in the form of formal debate resolutions, opening "statements," transcripts of a "face-to-face shoot-out" at a convention of the National Reading Conference in San Antonio, Texas, further written responses, and commentary on the debate.

Contents of the book are: "And the Winner Is...!" The Context of the Debate" (Carl B. Smith); "Call Me Teacher" (Susan Ohanian); "Whole

Language and Research: The Case for Caution" (Michael C. McKenna and others); "Moderator's Comments" (Carl B. Smith); "The Answer Is Yes..." (Patrick Shannon); "Unlike Patrick, We Do Accept Reality..." (Michael McKenna); "Who the Hell Are You?" (Susan Ohanian); "Let Us Not Permit Ourselves to Be Forced into Bitterly Polarized Positions..." (Richard Robinson); "Audience Participation" (moderated by Carl B. Smith); "People Who Live in Glass Houses..."

(Patrick Shannon); "Emerging Perspectives on Whole Language" (Michael C. McKenna and others); "Whole Language: Now More Than Ever" (Shelley Harwayne); "Is Whole Language 'The Real Thing'?" Advertisements and Research in the Debate on Whole Language" (Steven Stahl); "New Questions, Different Inquiries" (Jerome Harste); and "Commentary on the ERIC Whole Language Debate" (Michael Pressley). A selected, annotated bibliography of approximately 1,000 items

from the ERIC database concerning whole language is included. (RS) *Basic* Cengage Learning

Abstract: This recommended practice encompasses the monitoring of electrical characteristics of single-phase and polyphase ac power systems. It includes consistent descriptions of

conducted electromagnetic phenomena occurring on power systems. This recommended practice describes nominal conditions and deviations from these nominal conditions that may originate within the source of supply or load equipment or may originate from interactions between the source and the load. Also, this recommended practice discusses power quality monitoring devices, application techniques, and the interpretation of monitoring results.

Keywords: assessment, compatibility, dip, distortion, electromagnetic phenomena, harmonics, imbalance, instruments, monitoring, power quality, rms variation, sag, swell, transient, unbalance.
