The Metropolitan Museum of Art houses one of the world's largest and most comprehensive collections of works of art from antiquities to modern and contemporary material. Their preservation is a responsibility shared by the many individuals employed at the Museum who oversee and have direct contact with the collection on a daily basis. The *Care and Handling of Art Objects*—first published in the 1940s and continually updated—offers a guide to the best practices in handling and preserving works of art while on display, in storage and in transit. It explains many of the fundamental principles of conservation that underlie these methods. One of its goals is to make the complexities of caring for a collection readily accessible. The first part offers basic guidelines for the preservation of the diverse types of materials and art objects found in the Met. Each chapter addresses the physical characteristics specific to the particular category, and the environmental, handling and housing factors to which one should be alert to prevent damage and ensure their preservation. Written by experts in the respective specialty, it

addresses the Museum's vast holdings summarizing the most critical preservation issues, many of which are amplified by photographs. As the table of contents makes evident these range from paintings on canvas and works on paper and photographs to furniture and objects made of stone, wood and metals to arms and armor, upholstery, ethnographic materials and many others. Part II succinctly describes factors that affect the collection as a whole: among them, current environmental standards for temperature, relative humidity, light exposure, storage and art in transit. Based on Museum protocols it addresses emergency preparedness and response, and integrated pest management. For easy reference, it includes charts on storage and display conditions, on factors contributing to deterioration, and a glossary of conservation terms, principles, and housing materials referenced in the individual chapters. Drawing upon the knowledge of conservators, scientists, and curators from many different departments, as well as technicians and engineers whose expertise crosses boundaries of culture, chronology, medium and condition, *The Care and Handling of Art Objects* is primarily directed to staff at the Met. It is, no less, an invaluable resource for students, collectors, small museums, museum study programs, art dealers, and members of the public who want to enhance their understanding of how works of art are safeguarded and the role environment, handling and materials play in making this possible.

This go-to reference work surveys the current state of knowledge in the field of metal soap-related degradation phenomena in art works. It contains detailed descriptions and images of the different phenomena and addresses the practical aspects of soap formation, preventive conservation, and treatment. The occurrence of metal soaps is one of the defining issues in the conservation of painted surfaces, and one that presently leaves innumerable open questions. It is estimated that around 70% of paintings in museum collections are affected by some form of metal soap-related degradation. In recent years, significant advances have been made in the detection and characterization of these compounds through interdisciplinary approaches including conventional spectroscopy and microscopy as well as emerging synchrotron-based techniques. This book for the first time captures a panoramic overview of the state of knowledge of metal soaps related to both scientific analysis and implications for conservation and treatment. It also critically examines open questions. The book is accessible to audiences with varied backgrounds (e.g. conservators, students of conservation science) while simultaneously presenting the technical details indispensable for academics and researchers active in this field.

IR spectroscopy has become without any doubt a key technique to answer questions raised when studying the interaction of proteins or peptides with solid surfaces for a fundamental point of view as well as for technological applications. Principle, experimental set ups, parameters and interpretation rules of several advanced IR-based techniques; application to biointerface characterisation through the presentation of recent examples, will be given in this book. It will describe how to characterise amino acids, protein or bacterial strain interactions with metal and oxide surfaces, by using infrared spectroscopy, in vacuum, in the air or in an aqueous medium. Results will highlight the performances and perspectives of the technique. Description of the principles, expermental setups and parameter interpretation, and the theory for several advanced IR-based techniques for interface characterisation. Contains examples which demonstrate the capacity, potential and limits of the IR techniques. Helps finding the most adequate mode of analysis. Contains examples. Contains a glossary by techniques and by keywords.
