Photography is the primary tool for visually documenting specimens, experimental findings and laboratory setups in many scientific fields. Photographic illustrations in these fields must satisfy criteria of clarity, objectivity and adherence to accepted standards, in addition to a pleasant but not distracting composition and illumination. This book concentrates on the choice and practical use of digital cameras, lenses and related

equipment of types commonly available at research institutions and museums. The described techniques are suitable for subject sizes between approximately half a millimeter and half a meter, and differ from those used in general photography and microscopy. The intended audience of this book includes professional scientific photographers, scientists and students who need to carry out photography in support of their own research or as part-time scientific photographers at a research institution, and advanced amateur photographers who wish to master these techniques.

Film is back! And about time, too. We just were getting a little too comfortable with the idea of snapping selfies on our dumb phones at the ends of vanity sticks when film returned to slap us up. Film is not for the faint of heart. It takes serious

effort, serious time. It costs money for each frame, from buying the film to paying to develop it or developing it in a film tank. Only those interested in the unique and fantastic look of film will brave this path. The Film Photography Book is for us, those interested in all aspects of film photography from choosing cameras and lenses, to choosing film and subjects, to buying chemicals and processing. The book can serve as a refresher to those who now are returning to film photography after a long absence, and as a "getting started" course for those who never shot film in their lives. It's an adventure, a new Voyage of Photography, part of Shawn M. Tomlinson's Guide to Photography Series, the beginning of a sub-series about film photography. Come on along.
