This book explains how to take surreptitious photographs and record video of people and property in a safe and effective manner while producing excellent results. It is the most comprehensive text on clandestine photography available. It takes the reader through conventional as well as the most sophisticated clandestine photography methods in practice today, and it covers the use of all types of equipment ranging from off-the-shelf to the most high-tech equipment available. The ultra-long-range night vision photography methods discussed in this book were devised by the authors and only exist here. Readers will discover esoteric techniques for photographically recording recognizable human and vehicle plate images from distances of over a mile in both daylight and night conditions. Myriad methods for secretly photographing people and property under diverse

and difficult conditions are presented. Readers will discover innovative applications of combinations of old and new photographic-related technologies—some combined in unexpected ways that produce surprising results. It is written and extremely well illustrated in an easy to understand style for all photographers regardless of skill level. The book is appropriate for anyone in law enforcement, military operations, and private investigation. It will also benefit government surveillance specialists and those responsible for detecting and thwarting manual clandestine photography.

Transporters and channels are membrane proteins that mediate the traffic of metabolites, water and ions across biological membranes. Membrane transport proteins are crucial to maintain homeostasis and assure cell survival upon intracellular or environmental stress. A failure of any of these transport systems may have dramatic consequences for cell function. There is increasing evidence that membrane transport proteins play important functions in healthy conditions and that their absence or dysfunction may cause diseases. In recent years much attention has been paid to diseases resulting from defective transporters ( “ carrier diseases ” ) and ion channels ( “ channelopathies ” ). Very interestingly, altered expression of

transporters has been described in several human pathologies. On this basis, many transport proteins are well acknowledged targets for drugs. Many others are involved in drug delivery and disposition and/or are considered potential targets. Others are off-targets for drugs and then, are responsible for side effects. Thus, membrane protein drug discovery is now an emerging field where the search for physiological mechanisms of regulation and for chemical compounds as modulators of transport activity, present new opportunities for drug development and for new therapies. This Research Topic addresses the latest research advances in membrane transport proteins, stimulating future research on these important protein families. **Captured: Behind the Lens of a Legendary Wildlife Photographer** is more than just a photography book—it's a chronicle of more than 30 years' worth of unbelievable moments that only nature can reveal. And Moose Peterson is more than just a wildlife photographer—he's a storyteller in both prose and pictures. If you're looking for the ultimate guide to wildlife photography from a man

who has devoted his entire career to capturing nature's finest and most rare moments, you'll find it here in Captured. If you're looking to be transported into the wild to confront a grizzly bear and her cubs, stumble upon a pack of wolves, or capture an owl in flight, you'll find it here, as well. You'll also find a healthy dose of inspiration as the stories behind the photos are revealed as only Moose can tell them. In the end, you'll come away with invaluable photographic techniques gained through a lifetime of experience and a new appreciation for the passion of wildlife photography. You'll gain knowledge that you can put to use on your next excursion into the wild, your local or state park, or even your own backyard.

Monitoring of vegetation structure and functioning is critical to modeling

terrestrial ecosystems and energy cycles. In particular, leaf area index (LAI) is an important structural property of vegetation used in many land surface vegetation, climate, and crop production models. Canopy structure (LAI, fCover, plant height, and biomass) and biochemical parameters (leaf pigmentation and water content) directly influence the radiative transfer process of sunlight in vegetation, determining the amount of radiation measured by passive sensors in the visible and infrared portions of the electromagnetic spectrum. Optical remote sensing (RS) methods build relationships exploiting in situ measurements and/or as outputs of physical canopy radiative transfer models. The increased availability of passive (radar and LiDAR) RS data has fostered their use in many applications for the analysis of land surface properties and processes, thanks also to their insensitivity to weather conditions and the capability to exploit rich structural and textural information. Data fusion and multi-sensor integration techniques are pressing topics to fully exploit the

information conveyed by both optical and microwave bands.

Captured "O'Reilly Media, Inc." This Special Issue on the Systematics and Phylogeny of Weevils presents 31 new research papers on one of the most diverse and successful groups of animals on Earth, the beetle superfamily Curculionoidea. It was in part inspired to commemorate the extraordinary life and scientific achievements of Guillermo ( " Willy " ) Kuschel (1918 – 2017), who shaped this field of science over the last century like no other weevil systematist. The papers in this memorial issue span weevil faunas from all over the globe, including South and Central America, Africa, Europe and the Near East, South-East Asia, New Guinea, Australia and New Zealand. They include major advances on the phylogeny and classification of the " broad-nosed " weevils (Entiminae), on the weevils associated with American cycads

and on the unique extinct weevil fauna preserved in the 100-million-year-old Burmese amber, when weevils started to diversify alongside the oldest angiosperm plants. They comprise a tribute to Willy Kuschel, the proceedings of a weevil symposium held in his honor in 2016 in Orlando, Florida, 24 systematic studies (including seven phylogenetic analyses) and five other contributions on the diversity, biology, distribution, evolution and fossil history of weevils. In the papers collated in this volume, 30 new genera and 92 new species of weevils are described and a new family of extinct weevils is recognized.
