While some writers account for Japan's
postwar economic "miracle" in terms of a
distinctively Japanese, traditional model of
social organization, the writers of this study
consider Japan's technological growth to
have been accompanied by convergence
toward modernized social organization. The
authors test both of these theoretical
models. Their data are derived from a nine-
month period of observation, analysis of
company records, interviews of personnel,
and questionnaire responses from

production, staff, and managerial employees in three main Japanese firms. Other firms were visited more briefly. The analysis shows that the most distinctively Japanese variables have less causal impact on performance within a firm than do more universal variables such as employee status, sex, and job satisfaction.
