Advanced building automation technologies include a decision-making

ability within the individual control devices, which are linked by a common data communication protocol that governs the electronic signals passed between devices to ensure that they are all speaking the same language. If the structure of the protocol language is available to all manufacturers so that they can produce and market compatible control devices, then it is known as an open protocol. Building Automation: System Integration with Open Protocols is the second book in a two-book series on building automation. The first book, Building Automation: Control Devices and Applications, addresses the basic functions of building systems and how devices are used to monitor and control these systems. This second book introduces

the concepts of intelligent devices, automated control, and network communication using open protocols. The two primary protocols for wired networks, LonWorks® and BACnet®, are described in detail, including information about their communication methods, information architecture, configuration, operation, and troubleshooting. Building Automation: System Integration with Open Protocols provides a foundation of control concepts and network data communication in the first three chapters. After the LonWorks and BACnet sections, the final three chapters offer capstone coverage of previous chapter concepts and their relationships. The System Integration chapter includes a series of applications that illustrate the design, installation, and configuration of each protocol in various scenarios. Applications highlight the implementation differences between the protocols in different situations. The Cross-Protocol Integration chapter discusses the future of building automation, such as

greater capabilities in system control and new technologies in network communication and protocol languages.

Building a Foundation in Mathematics The Rosen Publishing Group, Inc
After a period of relative

neglect in many countries, apprenticeships and other forms of work-based learning are experiencing a revival. Their effectiveness in easing school-to-work transitions and serving the economy is increasingly recognised. However, engaging individuals, employers, social partners and education and training systems in such learning remains a significant challenge. In light of this, *Seven Questions about Apprenticeships* draws out policy messages on how to design and implement high-quality apprenticeships, using material from the OECD project *Work-based Learning in Vocational Education and Training*. It presents answers to seven questions commonly asked by governments and practitioners seeking to either introduce or reform apprenticeship systems for young people and/or older workers. Can apprenticeships provide a useful contribution in every country? Should employers receive financial incentives for providing apprenticeships? What is the right wage for apprentices, and how long should an apprenticeship last? How can we ensure a good learning experience at work? How can apprenticeships be made to work for youth at

risk? And how to attract potential apprentices? The study establishes principles of effective practice by building on new analytical work and examples of effective practice from around the world.

This book covers material challenges and technology innovation in coated and laminated textiles for aerostats and airships.

Aerostats/airships are lighter-than-air (LTA) aircraft which are generally used in defence applications and face many harsh environmental conditions. For sustaining such conditions, there are special requirements for the material to be used in aerostats/airships which generally include a multi-layered coated/laminated textile using a textile fabric in base layer and different polymers for coating/lamination. Therefore, this book covers typical materials

developed by different countries, challenges for developing material for aerostat/airship envelope and the future scope. Features: Exclusive title on materials used for LTA envelopes. Discusses material challenges such as selection of suitable fibre, polymer, additive, coating/lamination techniques, joint type and sealing techniques. Includes typical materials developed by different companies and researchers worldwide. Clearly explains technical concepts using figures, schemes and tabulated data.
