Absolute zero is the lowest limit of the thermodynamic temperature scale, a state at which the enthalpy and entropy of a cooled ideal gas reach their minimum value, taken as zero kelvins. The fundamental particles of nature have minimum vibrational motion, retaining only quantum mechanical, zero-point energy-induced particle motion. The theoretical temperature is determined by extrapolating the ...

When people asked me what I was reading, I really enjoyed saying I've been reading 'Nothing' ! Brilliant book and a great little read. Encompasses all sorts of 'nothings' from the power of the placebo effect, the Big Bang, the power of the mind in healing, black holes, vacuums, absolute zero, lazy animals and what the brain is really doing when it's doing 'Nothing'.

"We then conclude that it is impossible to cool a system to absolute zero in a finite time, and we established a relation between time and the lowest possible temperature. It's the speed of cooling." What Masanes is referring to here are two fundamental assumptions that the third law of thermodynamics depends on for its validity.

Absolute zero, temperature at which a thermodynamic system has the lowest energy. It corresponds to minus 273.15 degrees Celsius and to minus 459.67 degrees Fahrenheit. While all molecular movement does not cease at absolute zero, no energy from that motion is available for transfer to other systems.

The subtitle is From Absolute Nothing to Cosmic Oblivion. It's a history of the number zero, how medieval Europe struggled with the existential crisis that such a number would create. It's about zero as a mathematical concept and a physical number, its importance to astronomy, to physics and to science in general.
