Born Smart Oxford University Press

Akasha is a precocious young girl with dreams of motherhood. She lives in a fantastical world where most of the oceans circulate in the aquamarine sky waters. Before she was born, the Helios, a tribe of angels from the sun, came to Earth to deliver the Surge, the next step in the evolution of an embryonic human race. Instead they spawned a race of hybrids and infected humanity with a hybrid seed. Horque manifests on Earth with another tribe of angels, the Solarii, to rescue the genetic mix-up and release the Surge. Akasha embarks on a journey from maiden to mother and from apprentice to priestess then has a premonition that a great flood is imminent. All three races – humans, hybrids and Solarii – face extinction. With their world in crisis, Akasha and Horque meet, and a sublime love flashes between them. Is this a cause of hope for humanity and the Solarii? Or will the hybrids destroy them both? Will anyone survive the killing waters of the coming apocalypse?

Pairing scientists and philosophers together, this book is an exploration of some of the new frontiers in biology (e.g., Emergence, Complex Systems, Biosemiotics, Symbiogenesis, Organic Selection, Epigenetics, Niche Construction, Teleodynamics, etc.). The chapters in this volume challenge the mechanistic metaphysics that is implicit in the reigning neo-Darwinist paradigm, point to more inclusive modes of thinking in relation to the nature of life, and contribute to the novel synthesis that is presently “in the air.”

What's So Wrong with Being Absolutely Right Columbia University Press

A guide that explains the emotion-energy connection and how to harness its power to clear past trauma and fuel creative expression. Do you feel there is more to reality than what your five senses reveal? Are emotions

controlling the quality of your life? Do you avoid uncomfortable feelings or suppress past trauma? You may have been taught that emotions aren't logical and therefore can't be trusted. That happiness depends on suppressing or avoiding negative feelings. On the contrary, emotions are the key to discerning energy reality. They are the language of subtle energy providing information, direction, motivation, and vitality. Understanding and harnessing the power of emotions will help you make better decisions, heal your past, and create the life of your dreams. The Path of Emotions explains how emotions are the key to mind-body communication, translating information from subtle energy realms into useable guidance. Reading it will help you: Interpret your

instincts and gut reactions Expand your subtle energy awareness and increase your intuition Identify and release emotions that are binding your energy, inhibiting your potential, and causing physical pain and dysfunction Free up and use the energy currently bound up in limiting emotional patterns Use emotions to empower your intentions and manifest the life you desire “ Dr. Andrews shows how we can use our emotions to make ourselves miserable or happy. Then, more importantly, she shows us practical and effective ways we can channel that energy to take charge of our health and happiness and rid ourselves of our human barriers to love. ” —Henry Grayson, PhD, author of *Your Power to Heal Chromatin and Gene Regulation* John Wiley & Sons "Overall, its breaking of disciplinary isolation,

enhancing of mutual understanding, and laying out of a transdisciplinary platform makes this Handbook a milestone in identity studies." - Sociology

Increasingly, identities are the site for interdisciplinary initiatives and identity research is at the heart of many transdisciplinary research centres around the world.

No single social science discipline 'owns' identity research which makes it a difficult topic to categorize.

The SAGE Handbook of Identities systematizes this complex field by incorporating its interdisciplinary character to provide a comprehensive overview of its themes in contemporary research while still

acknowledging the historical and philosophical significance of the concept of identity. Drawing on a global scholarship the Handbook has four parts:

Frameworks: presents the main theoretical and methodological perspectives in identities research.

Formations: covers the major formative forces for identities such as culture, globalisation, migratory patterns, biology and so on. Categories: reviews

research on the core social categories central to

identity such as ethnicity, gender, sexuality, disability and intersections between these. Sites and Context: develops a series of case studies of crucial sites and contexts where identity is at stake such as social movements, relationships, work-places and citizenship.

Nearly half of all Americans will be diagnosed with an invasive cancer—an all-too ordinary aspect of daily life. Through a powerful combination of cultural analysis and memoir,

this stunningly original book explores why cancer remains so confounding, despite the billions of dollars spent in the search for a cure. Amidst furious debates over its causes and treatments, scientists generate reams of data—information that ultimately obscures as much as it clarifies. Award-winning anthropologist S. Lochlann Jain deftly unscrambles the high stakes of the resulting confusion. Expertly reading across a range of material that includes history, oncology, law, economics, and literature, Jain explains how a national culture that simultaneously aims to deny, profit from, and cure cancer entraps us in a state of paradox—one that makes the world of cancer virtually impossible to navigate for doctors, patients, caretakers, and policy makers alike. This chronicle, burning

with urgency and substance leavened with brio and wit, offers a lucid guide to understanding and navigating the quicksand of uncertainty at the heart of cancer. *Malignant* vitally shifts the terms of an epic battle we have been losing for decades: the war on cancer.

Genes and the Bioimaginary Basic Books

The first years of human life are more important than we ever realized. In *Scared Sick*, Robin Karr-Morse connects psychology, neurobiology, endocrinology, immunology, and genetics to demonstrate how chronic fear in infancy and early childhood—when we are most helpless—lies at the root of common diseases in adulthood. Compassionate and based on the latest research, *Scared Sick* will unveil a major public health crisis. Highlighting case studies and cutting-edge scientific findings, Karr-Morse shows how our innate fight-or-flight system can injure us if overworked in the early stages of life. Persistent stress can trigger diabetes, heart disease, obesity, depression,

and addiction later on.

Psychodrama and other action methods are especially helpful in the treatment of the classic eating disorders as well as dieting struggles, body dissatisfaction and associated issues of fear, sadness, silence and shame.

This book provides clinicians with sound theoretical information, practical treatment guidelines and a wealth of clinically-tested action structures and interventions. The authors describe how they have introduced action methods to work with a diverse range of clients, and suggest ways in which psychodrama practitioners, experiential therapists and others may integrate these methods into their practice. Offering fresh ideas for tailoring psychodramatic standards such as The Living

Newspaper, Magic Shop and the Social Atom to eating disorder issues, they provide extensive examples of psychodrama interventions - classic and specially adapted for eating disorders - for both the experienced practitioner and those new to experiential therapies. They also explain how psychodrama can be used in combination with other expressive, holistic and complementary approaches, including family constellations, music, art, imagery, ritual, Five Element Acupuncture, yoga, Reiki and other energy work. This pioneering book is essential reading for practitioners and students of psychodrama, drama therapy, experiential psychotherapy, cognitive and expressive arts therapies and mental health professionals, as well as professionals interested in complementary health modalities.

Epigenetics, the Environment, and Children ' s Health Across Lifespans Jessica Kingsley Publishers

Modern epigenetics unites scientists from life

sciences, organic chemistry as well as computer and engineering sciences to find an answer to the question of how environmental influences can have a lasting effect on gene expression, maybe even into the next generations. This volume examines from an interdisciplinary perspective the ethical, legal and social aspects of epigenetics.

Islands of Genius Springer Science & Business Media
There are now compelling human epidemiological and animal experimental data that indicate the risk of developing adult-onset complex diseases and neurological disorders are influenced by persistent epigenetic adaptations in response to prenatal and early postnatal exposures to environmental factors. Epigenetics refers to heritable changes in gene function that occur without a change in the sequence of the DNA. The main components of the epigenetic code are DNA methylation, histone modifications, and non-coding RNAs. The epigenetic programs are

established as stem cell differentiate during embryogenesis, and they are normally faithfully reproduced during mitosis. Moreover, they can also be maintained during meiosis, resulting in epigenetic transgenerational disease inheritance, and also potentially introducing phenotypic variation that is selected for in the evolution of new species. The objective of this book is to provide evidence that environmental exposures during early development can alter the risk of developing medical conditions, such as asthma, autism, cancer, cardiovascular disease, diabetes, obesity, and schizophrenia later in life by modifying the epigenome.

The SAGE Handbook of Identities Simon and Schuster

Epigenetics can potentially revolutionize our understanding of the structure and behavior of biological life on Earth. It explains why mapping an organism's genetic code is not enough to determine how it develops or acts and shows how nurture combines with nature to engineer biological diversity.

Surveying the twenty-year history of the field while also highlighting its latest findings and innovations, this volume provides a readily understandable introduction to the foundations of epigenetics. Nessa Carey, a leading epigenetics researcher, connects the field's arguments to such diverse phenomena as how ants and queen bees control their colonies; why tortoiseshell cats are always female; why some plants need cold weather before they can flower; and how our bodies age and develop disease. Reaching beyond biology, epigenetics now informs work on drug addiction, the long-term effects of famine, and the physical and psychological consequences of childhood trauma. Carey concludes with a discussion of the future directions for this research and its ability to improve human health and well-being.

The World's first book on how a pregnant mother can help her baby increase his intelligence before birth. Why do some babies develop faster than others? Even siblings can differ greatly in appearance and developmental milestones. Searching for answers, after an unusual pregnancy, delivered an out of the ordinary baby. Jeanette Bolvary discovered research published in 2007 about copper. This nutrient, potentially fatal in excess amounts, is also responsible for the development of the hippocampus and dentate gyrus (the higher learning and higher thinking areas in the brain). The discovery in 2007 of a gene and its transporters, responsible for the delivery of copper to an unborn baby, provide us with the information we need to help our baby develop the higher thinking and higher learning areas of the brain, increasing a baby's

intelligence before he is even born.
