For simple models you can use calculus, trigonometry, and other math techniques to find a function which is the exact solution of the differential equation. This is called the analytic solution (because you use analysis to figure it out). It is also referred to as a closed form solution.

The solution is found to be  $u(x) = |\sec(x+2)|$  where  $\sec(x) = 1/\cos(x)$ . But  $\sec$  becomes infinite at  $\pm \pi/2$  so the solution is not valid in the points  $x = -\pi/2 - 2$  and  $x = \pi/2 - 2$ . Note that the domain of the differential equation is not included in the Maple dsolve command. The result is a function that solves the differential equation for some  $x$ -values. It is up to

This section under major construction. Solving differential equations is a fundamental problem in science and engineering. A differential equation is ... For example:  $y' = -2y$ ,  $y(0) = 1$  has an analytic solution  $y(x) = \exp(-2x)$ . Laplace's equation  $\frac{d^2}{dx^2} + \frac{d^2}{dy^2} = 0$  plus some boundary conditions. Sometimes we can find closed-form solutions using calculus.

### Numerical Solutions to Differential Equations

Numerical methods for ordinary differential equations are methods used to find numerical approximations to the solutions of ordinary differential equations. Their use is also known as "numerical integration", although this term is sometimes taken to mean the computation of integrals. Many differential equations cannot be solved using symbolic computation. For practical purposes, however – such as in engineering – a numeric approximation to the solution is often sufficient. The algorithms ...

Differential equations are among the most important mathematical tools used in producing models in the physical sciences, biological sciences, and engineering. In this text, we consider numerical methods for solving ordinary differential equations, that is, those differential equations that have only one independent variable.

The aim of this paper is to modify the method derived from the Grünwald-Letnikov definition for fractional derivative, used for computing numerical solutions of fractional-order differential equations in the sense of Riemann-Liouville's definition to accommodate Caputo's definition in the case of non zero initial conditions in which the infinite memory effect of fractional calculus is adequately dealt with.
