This book introduces students of education to the elements of educational psychology. It also relates as closely as possible the findings of research to classroom practice. In order to make clear the fundamental processes involved in psychological development, the book starts with a study of the way in which the young child adapts its behaviour to its environment. This study considers some

of the key aspects of physical development, mainly the central nervous system. At the same time the way physical growth and psychological development are influenced by the experience of the individual is also discussed. This discussion of development is followed by an examination of the processes of learning, with particular attention paid to the works of Piaget. The salient points of each chapter are brought together in a summary which may be used by the reader to obtain a preliminary overview of the content of the chapter, and as an aid to revision.

No work has ever been produced previously that shows how historically geography has been constructed as a subject for the senior years of secondary schooling in Western Australia from 1917 to 1997. In doing so, this book contributes to the existing corpus of international research on the history of curriculum and particularly the history of geography as a senior secondary school subject. Much of it is based on primary sources, including the textbooks and atlases used, along with syllabus manuals and geography examination papers. It also provides a framework for investigating the construction of senior secondary school geography curricula in other constituencies, and could act as a model for engaging in further research in curriculum history for other school subjects state-wide, nationally and internationally. The book also makes an important contribution to the fields of curriculum design, curriculum development and curriculum innovation. It will be of great interest to historians of education, comparative educationists, education leaders, policy makers and librarians.
