The objectives of this study are to describe experiences in price setting and how pricing has been used to attain better coverage, quality, financial protection, and health outcomes. It builds on newly commissioned case studies and lessons learned in calculating prices, negotiating with providers, and monitoring changes. Recognising that no single model is applicable to all settings, the study aimed to generate best practices and identify areas for future research, particularly in low- and middle-income settings. The report and the case studies were jointly developed by the OECD and the WHO Centre for Health Development in Kobe (Japan).

Imagine, if you can, the world in the year 2100. In **Physics of the Future**, Michio Kaku—the New York Times bestselling author of **Physics of the Impossible**—gives us a stunning, provocative, and exhilarating vision of the coming century based on interviews with over three hundred of the world's top scientists who are already inventing the future in their labs. The result is the most authoritative and scientifically accurate description of the revolutionary developments taking place in medicine, computers, artificial intelligence, nanotechnology, energy production, and astronautics. In all likelihood, by 2100 we will control computers via tiny brain sensors and, like magicians, move objects around

with the power of our minds. Artificial intelligence will be dispersed throughout the environment, and Internet-enabled contact lenses will allow us to access the world's information base or conjure up any image we desire in the blink of an eye. Meanwhile, cars will drive themselves using GPS, and if room-temperature superconductors are discovered, vehicles will effortlessly fly on a cushion of air, coasting on powerful magnetic fields and ushering in the age of magnetism. Using molecular medicine, scientists will be able to grow almost every organ of the body and cure genetic diseases. Millions of tiny DNA sensors and nanoparticles patrolling our blood cells will silently scan our bodies for the first sign of illness, while rapid advances in genetic research will enable us to slow down or maybe even reverse the aging process, allowing human life spans to increase dramatically. In space, radically new ships—needle-sized vessels using laser propulsion—could replace the expensive chemical rockets of today and perhaps visit nearby stars. Advances in nanotechnology may lead to the fabled space elevator, which would propel humans hundreds of miles above the earth's atmosphere at the push of a button. But these astonishing revelations are only the tip of the iceberg. Kaku also discusses emotional robots, antimatter rockets, X-ray vision, and the ability to create new life-forms, and he considers the development of the world economy. He addresses the key questions: Who are the winner and losers of the future? Who will have jobs, and which nations will prosper? All the while, Kaku illuminates the rigorous scientific principles, examining the rate at which certain technologies are likely to mature, how far they can advance, and what their ultimate limitations and hazards are. Synthesizing a vast amount of information to construct an exciting look at the years leading up to 2100, **Physics of the Future** is a thrilling, wondrous ride through the next 100 years of breathtaking scientific revolution.

Diane France loves bones. Why? Because they talk to her. Every skeleton she meets whispers secrets about the life-and death-of its owner. Diane France can hear those secrets because she's a forensic anthropologist, a bone detective. She has the science skills and know-how to examine bones for clues to a mystery: Who was this person and how did he or she die? Bones tell Diane about the life and times of famous people in history, from a Russian royal family to American outlaws and war heroes. They speak to her about murders, mass disasters, and fatal accidents. One day she's collecting skeletal evidence at a crime scene. A phone call later she's jetting to the site of a plane crash or other unexpected tragedy to identify victims. Young readers will be captivated by the thrilling

real-life story of this small-town girl full of curiosity and mischief who became a world-famous bone detective.

Evolution Education Re-considered Joseph Henry Press

"Having been born a freeman, and for more than thirty years enjoyed the blessings of liberty in a free State—and having at the end of that time been kidnapped and sold into Slavery, where I remained, until happily rescued in the month of January, 1853, after a bondage of twelve years—it has been suggested that an account of my life and fortunes would not be uninteresting to the public." -an excerpt

This collection presents research-based interventions using existing knowledge to produce new pedagogies to teach evolution to learners more successfully, whether in schools or elsewhere. 'Success' here is measured as cognitive gains, as acceptance of evolution or an increased desire to continue to learn about it. Aside from introductory and concluding chapters by the editors, each chapter consists of a research-based intervention intended to enable evolution to be taught successfully; all these interventions have been researched and evaluated by the chapters' authors and the findings are presented along with discussions of the implications. The result is an important compendium of studies from around the world conducted both inside and outside of school. The volume is unique and provides an essential reference point and platform for future work for the foreseeable future.

This open access book offers an overview of the beautiful, powerful, and dynamic array of opportunities to promote health through the arts from theoretical, methodological, pedagogical, and critical perspectives. This is the first-known text to connect the disparate inter-disciplinary literatures into a coherent volume for health promotion practitioners, researchers, and teachers. It provides a one-stop depository for using the arts as tools for health promotion in many settings and as bridges across communities, cultures, and sectors. The diverse applications of the arts in health promotion transcend the multiple contexts within which health is created, i.e., individual, community, and societal levels, and has a number of potential health, aesthetic, and social outcomes. Topics covered within the chapters include: Exploring the Potential of the Arts to Promote Health and Social Justice Drawing as a Salutogenic Therapy Aid for Grieving Adolescents in Botswana Community Theater for Health Promotion in Japan From Arts to Action: Project SHINE as a Case Study of Engaging Youth in Efforts to Develop Sustainable Water, Sanitation, and Hygiene Strategies in Rural Tanzania and India Movimiento Ventana: An Alternative Proposal to Mental Health in Nicaragua Using Art to Bridge Research and Policy: An Initiative of the United States National Academy of Medicine Arts and Health Promotion is an innovative and engaging resource for a broad audience including practitioners, researchers, university instructors, and artists. It is an important text for undergraduate- and graduate-level courses, particularly in program planning, research methods (especially qualitative methodology), community health, and applied art classes. The book also is useful for professional development among current health promotion practitioners, community nurses, community psychologists, public health professionals, and social workers.

This book is a primer on Stepped Care 2.0. It is the first book in a series of three. This primer addresses the increased demand for mental health care by supporting stakeholders (help-seekers,

providers, and policy-makers) to collaborate in enhancing care outcomes through work that is both more meaningful and sustainable. Our current mental health system is organized to offer highly intensive psychiatric and psychological care. While undoubtedly effective, demand far exceeds the supply for such specialized programming. Many people seeking to improve their mental health do not need psychiatric medication or sophisticated psychotherapy. A typical help seeker needs basic support. For knee pain, a nurse or physician might first recommend icing and resting the knee, working to achieve a healthy weight, and introducing low impact exercise before considering specialist care. Unfortunately, there is no parallel continuum of care for mental health and wellness. As a result, a person seeking the most basic support must line up and wait for the specialist along with those who may have very severe and/or complex needs. Why are there no lower intensity options? One reason is fear and stigma. A thorough assessment by a specialist is considered best practice. After all, what if we miss signs of suicide or potential harm to others? A reasonable question on the surface; however, the premise is flawed. First, the risk of suicide, or threat to others, for those already seeking care, is low. Second, our technical capacity to predict on these threats is virtually nil. Finally, assessment in our current culture of fear tends to focus more on the identification of deficits (as opposed to functional capacities), leading to over-prescription of expensive remedies and lost opportunities for autonomy and self-management. Despite little evidence linking assessment to treatment outcomes, and no evidence supporting our capacity to detect risk for harm, we persist with lengthy intake assessments and automatic specialist referrals that delay care. Before providers and policy makers can feel comfortable letting go of risk assessment, however, they need to understand the forces underlying the risk paradigm that dominates our society and restricts creative solutions for supporting those in need.

New drugs, new devices, improved surgical techniques, and innovative diagnostic procedures and equipment emerge rapidly. But development of these technologies has outpaced evaluation of their safety, efficacy, cost-effectiveness, and ethical and social consequences. This volume, which is "strongly recommended" by The New England Journal of Medicine "to all those interested in the future of the practice of medicine," examines how new discoveries can be translated into better care, and how the current system's inefficiencies prevent effective health care delivery. In addition, the book offers detailed profiles of 20 organizations currently involved in medical technology assessment, and proposes ways to organize U.S. efforts and create a coordinated national system for evaluating new medical treatments and technology.

Since 1945, a broad array of health care technologies have come into use, including antibiotics, anti-hypertensive drugs, oral diuretics, oral contraceptives, psycho-pharmaceuticals, corticosteroids, vaccines, open-heart surgery, genetics screening, automated clinical laboratories, renal dialysis, and cardiac pacemakers. Unquestionably, these technologies have brought benefits to millions. However, as costs of health care have risen rapidly, governments have increasingly singled out expensive technology as the culprit. The result has been changes in the methods of paying for health care in most countries to control cost rises. This has led to a slowing of technological change in some countries and increasing necessities to choose in all countries. This timely work describes how technology assessment critically evaluates the benefits, costs, and social implications of technology. The book presents an international perspective on health care technology's development and diffusion, and explains how health care technology can enlighten difficult choices faced by policy-makers, clinicians, and patients.
