Occupational Outlook Handbook DIANE Publishing Engineering skills and knowledge are foundational to technological innovation and development that drive long-term economic growth and help solve societal challenges. Therefore, to ensure national

competitiveness and quality of life it is important to understand and to continuously adapt and improve the educational and career pathways of engineers in the United States. To gather this understanding it is necessary to study the people with the engineering skills and knowledge as well as the evolving system of institutions, policies, markets, people, and other resources that together prepare, deploy, and replenish the nation's engineering workforce. This report explores the characteristics and career choices of engineering graduates, particularly those with a BS or MS degree, who constitute the vast majority of degreed engineers, as well as the characteristics of those with non-

engineering degrees who are employed as engineers in the United States. It provides insight into their educational and career pathways and related decision making, the forces that influence their decisions, and the implications for major elements of engineering education-to-workforce pathways.

Handbook Claitor's Pub

World-renowned economist
Klaus Schwab, Founder and
Executive Chairman of the
World Economic Forum,
explains that we have an
opportunity to shape the
fourth industrial revolution,
which will fundamentally alter
how we live and work.
Schwab argues that this
revolution is different in scale,
scope and complexity from
any that have come before.

Characterized by a range of
new technologies that are
fusing the physical, digital and
biological worlds, the
developments are affecting all
disciplines, economies,
industries and governments,
and even challenging ideas
about what it means to be
human. Artificial intelligence
is already all around us, from
supercomputers, drones and
virtual assistants to 3D
printing, DNA sequencing,
smart thermostats, wearable
sensors and microchips
smaller than a grain of sand.
But this is just the beginning:

nanomaterials 200 times stronger than steel and a million times thinner than a strand of hair and the first transplant of a 3D printed liver are already in development. Imagine “ smart factories ” in which global systems of manufacturing are coordinated virtually, or implantable mobile phones made of biosynthetic materials. The fourth industrial revolution, says Schwab, is more significant, and its ramifications more profound, than in any prior period of human history. He outlines

the key technologies driving this revolution and discusses the major impacts expected on government, business, civil society and individuals. Schwab also offers bold ideas on how to harness these changes and shape a better future—one in which technology empowers people rather than replaces them; progress serves society rather than disrupts it; and in which innovators respect moral and ethical boundaries rather than cross them. We all have the opportunity to contribute to developing new frameworks

that advance progress.
