Based on a bestselling book originally published in Japanese, Manufacturing Technology Transfer: A Japanese Monozukuri View of Needs and Strategies offers time-tested methods and little-known tips for achieving successful transfer of technology along with the skills required to operate that technology. Designed to support a series of lectures on technology transfer within a master's course on the management of technology, it presents the results of years of research carried out at Hiroshima University. The book delves into the authors' decades of experience transferring technology between Japan and the rest of the world, particularly to developing countries from where much of the world's future economic growth is expected. It contains case studies of successful technology transfers from both the ship building and food equipment industries. Its wide-reaching coverage examines methods of skill transfer, production management, and manufacturing company classification. Introducing readers to the engineering activities that occur within the manufacturing industry, the book illustrates the engineering technology activities involved in manufacturing, along with the production management activities required to support them. It also explains how job simulators can help shorten learning times in the manufacturing industry in the same way that flight simulators are used to teach flying skills to pilots. The book outlines a framework for teaching and learning processes that can be visualized in terms of an S-shaped learning curve. It explains how technology transfer overseas should be supported by contractual agreements between the parties concerned. Detailing the legal/contractual responsibilities for all parties involved, it also describes what you should do if problems arise during the transfer. Integrating previously unpublished research results with illustrative case studies, this book is suitable for a wide audience within the manufacturing industry—including manufacturing engineering students in both developed and developing countries, those responsible for the development of manufacturing engineers in industry and elsewhere, and anyone interested in the international activities of Japanese manufacturing companies.

Flexible Manufacturing Systems

Introducing computers into production engineering has drastically reduced the "artisan skill" content traditionally required in manufacturing processes and replaced it with high-precision, computer-controlled machinery. While this reduces human error and variability in output, it does not eliminate the knowledge required of the professional engineering or shop floor worker. On the contrary, the reverse is true. Managers, engineers, and workers still need to understand the fundamentals while they need to acquire other skills. These highly-regarded authors combine more than 150 years of industrial and academic experience and expertise to provide readers

with the fundamentals of the subject, from digital manufacturing with CNC machine tools and FMS up to Industry 4.0, emphasizing the increased importance of automated manufacturing based on computerized systems (CAD, CAM, CAQ, etc.). Features This groundbreaking work introduces readers to CNC fundamentals, followed by a number of chapters which explain how different components are applied in practice. This logical approach is extended to the study of CNC and drives, tooling, flexible manufacturing systems (FMS), and finally to NC-programming, DNC, digital manufacturing, Industry 4.0 and computer integrated manufacturing (CIM). Additional chapters cover industrial robots, additive manufacturing, energy-efficient manufacturing, simulation systems, state of the art of machine integrated measuring systems, and using touch probes and laser beams. Explains the functions and connections of all integrated components.
