Ever since television became practical in the early 1950s, closed-circuit television (CCTV) in conjunction with the light microscope has provided large screen display, raised image contrast, and made the images formed by ultraviolet and infrared rays visible. With the introduction of large-scale integrated circuits in the last decade, TV equipment has improved by leaps and bounds, as has its application in microscopy. With modern CCTV,

sometimes with the help of digital computers, we can distill the image from a scene that appears to be nothing but noise; capture fluorescence too dim to be seen; visualize structures far below the limit of resolution; crisp images hidden in fog; measure, count, and sort objects; and record in time-lapsed and high-speed sequences through the light microscope without great difficulty. In fact, video is becoming indispensable for harnessing the fullest capacity of the light microscope, a capacity that itself is much greater than could have been envisioned just a few years ago. The time seemed ripe then to review the basics of video, and of microscopy, and to examine how the two could best be combined to accomplish these tasks. The Marine Biological Laboratory short courses on Analytical and Quantitative Light Microscopy in Biology, Medicine, and the Materials Sciences, and the many inquiries I received on video microscopy, supported such an effort, and Kirk Jensen of Plenum Press persuaded me of its worth.

Industrial application of ion exchange membranes started from saline water desalination. However, now it extends widely in many fields such as drinking water or wastewater treatment, demineralisation of amino acid, whey, sugar liquor, recovery of useful components, treatment of organic substances and contributes to the improvement of our standard of living. The application of ion exchange

membranes must expand further if we pay attention to unique functions of the membranes for separating ionic species from non-ionic substances or other kinds of ionic species. This book discusses the performance of an electro-dialyser from the stand point of fundamental and practical views.

It is now clear that data based on the studies of fish eggs and larvae make a number of unique contributions to fishery science that are crucial for accurate assessment and management of fish populations, including those of commercially important fisheries. This valuable book demonstrates why fish eggs and larvae are important, how the characteristics of early life stages require a somewhat different research approach and how information on early life stages can be applied and interpreted to yield unique insights into fish populations. The editors of Fishery Science have drawn together an extremely useful and well-written book with contributions from internationally respected researchers from North America, Asia and Europe. Chapters include a discussion of the unique nature of early life stages, age and growth, mortality, recruitment, populations analysis, habitats, human impacts and management. A carefully selected set of case studies demonstrates several specific applications of early life history information to a number of fishery problems. Fishery Science was designed to complement existing textbooks and is an essential purchase for all fisheries students and professionals, and for biologists working on the early life stages of fish. This exciting book is also of great value to ecologists, marine, freshwater and environmental scientists, populations biologists and oceanographers. All libraries in universities and research establishments where biological and fishery science are studied and taught should have copies of this book available on their shelves.

Gene Manipulations in Fungi combines a review of classical fungal genetics, contemporary research, and responsible speculation about the future. This book focuses on yeasts and molds; because yeast is the primary model system for eukaryotes and that there is an elegant research on molds. The applications of fungi, including their economic importance, are addressed. The book emphasizes the need for improved transformation systems, appropriate vectors, and broadly applicable selectable markers in this field of interest. This book will help stimulate the development of innovative approaches in th ...

"Color Confidence is one book that no photographer, especially me, can afford to be without!" Art Morris, Photographer (www.birdsasart.com) Establishing a successful color management workflow that produces predictable results is an important -- yet tricky -- undertaking. Most photographers are all too familiar with the frustration of a print not matching the image on the monitor. In Color Confidence, digital imaging expert Tim Grey provides the crucial information you need to get the color you want, every time. His results-oriented guide shows you how to manage color

effectively across all devices. He demystifies complicated topics and takes you through each component of a color-managed workflow step-by-step. Designed for busy photographers, this full-color guide cuts through the theory, focusing on the practical information you need to make the best color decisions from capture to output.

Supported by Eurasia Pacific Uninet, the second international conference on "Archaeology and Conservation along the Silk Road" was jointly organized by Nanjing University China and Institute of Conservation, University of Applied Arts Vienna and held in May 2016 in China. Silk Road showcases the trans-continental cultural movements between Europe and Asia and this event encouraged researchers to reflect on popular as well as otherwise under-represented topics. This volume includes selected papers from the conference and merges aspects of archaeology with conservation. Subjects vary from field drawings, unique local techniques, spread of diseases and epidemics to DNA studies assessing population migration and mixture. Next Silk Road conference is planned for 2018 to carry forward the initiative of learning and exchange of knowledge.

Archaeology and Conservation along the Silk Road

This volume explores major light microscopic imaging modalities that can be used to view nervous tissue, and discusses the steps needed to use each of them, and ways to interpret the data. The chapters in this book cover topics such as atlas of insect brain; neuroanatomical tracing through fluorochrome expression; fluorescent probes for amyloids; or optical clearing for ultramicroscopy of GFP-expressing tissues. In the Neuromethods series style, chapters include the kind of detail and key advice from the specialists needed to get successful results in your laboratory. Authoritative and cutting-edge, Neurohistology and Imaging Techniques is a valuable resource for both expert and novice users of major light microscopic imaging techniques, and those interested in exploring alternate imaging tools.

Jeremy Green's systematic overview of maritime archaeology offers a step-by-step description of this fast-growing field. With new information about the use of computers and Global Positioning Systems, the second edition of this handbook shows how to extract as much information as possible from a site, how to record and document the data, and how to act ethically and responsibly with the artifacts. Treating underwater archaeology as a discipline, the book demonstrates how archaeologists, "looters," academics, and governments interact and how the market for archaeological artifacts creates obstacles and opportunities for these groups. Well illustrated and comprehensive in its approach to the subject, this book provides an essential foundation for everybody interested in underwater environments, submerged land structures, and conditions created by sea level changes. * Covers five broad areas: searching for sites,

recording sites, excavation, management of collections, and study, research and publication * Describes a variety of techniques and procedures in considerable detail, accessible to both professional and amateur archaeologists * More than 250 photographs, charts, and diagrams explain everything from how to operate a sextant and a hand-held GPS to how a swim line should be laid out by the dive team before excavation begins
