A modern ice-push ridge on the northwest shore of Gardner Lake in

southeastern Connecticut is 0.6-1.2 m high and 1.2-3.1 m wide. In February and March 1967, the positions of survey stakes placed on the lake ice were measured periodically. During the same period, air and ice temperature and solar radiation intensity were also recorded. Analysis of the data supports the hypothesis that thermal expansion of the lake ice rather than wind action, was the principal cause of ice push. An ice-temperature change of approximately 1C/hr increase for 6 hr was sufficient to induce ice thrust. In a 30-day period, the average net shoreward movement of the surveyed area of the ice surface was 1.0 m. During the 1966-67 winter, approximately 14 m<sup>3</sup> of beach material was reworked and deposited, forming a discontinuous ice-push ridge along 260 m of shoreline. (Author).

Growing up on an isolated island in the middle of Lake Erie, Aaron Sheftall learned to skate as a young child when extreme weather would cut off his small community -- and its legends about a lost colony of seals -- from the rest of the world. Now an elite figure skater, Aaron dreams of getting to the Olympics. Yet competition is fierce and

---

in a sport filled with injuries and drama, careers are short. But when a fluke accident changes the stakes for the entire U.S. team, Aaron sees his chance. Zack Kelly used to be a war reporter. But a successful book about his time covering global conflicts, an unsuccessful marriage, and a dose of PTSD have sidelined him from the journalism game. When an old friend calls him with a long-form assignment about competitive figure skating, Zack has no idea what he's getting into. He also doesn't care -- it's a change of scenery and a paycheck. Thrown together under circumstances neither of them are initially enthused about, Aaron and Zack ultimately embark on an unlikely -- and ill-advised -- romance about trust, myth, and what it really means to be comfortable in your own skin. Ink and Ice is part of the same series as After the Gold. The books can be read in any order. Katie and Brendan's story continues here as a key part of Aaron's coaching team.

For fans of Lee Child's Jack Reacher series, a gritty female character who's every bit as hostile toward the criminal element as Reacher is--and maybe more. When ICE Agent Pamela R. Stone is fired from her fifteen-year position with U.S. Immigration and Customs Enforcement, she can't hit the open road fast enough, wind in her hair, sun on her cheeks, a new motorcycle rumbling beneath her. Instead of bidding adiós to Texas in her rear-view mirror as planned, she meets Detective Pete Anderson, who

questions her concerning a triple homicide. The conversation soon turns personal, and before Reid knows it, not only is she involved with the detective, she's involved with another murder. When Detective Anderson admits to the true reason for taking an interest in Reid, she must choose between continuing on her journey or the hazards of traveling into Mexico ? to rescue a kidnap victim from a prostitution kingpin. However dangerous the choice might be, Reid has no problem taking the risk. If the opportunity to remove the criminal element from the human food chain presents itself, she's willing to do her part--because so few will.

**Making Deep History** Oxford University Press  
This book is the fourth volume in the definitive series, The History of the Study of Landforms or The Development of Geomorphology. Volume 1 (1964) dealt with contributions to the field up to 1890. Volume 2 (1973) dealt with the concepts and contributions of William Morris Davis. Volume 3 (1991) covered historical and regional themes during the 'classic' period of geomorphology, between 1980 and 1950. This volume concentrates on studies of geomorphological processes and Quaternary geomorphology, carrying on these themes into the second part of the twentieth century, since

---

when process-based studies have become so dominant. It is divided into five sections. After chapters dealing with geological controls, there are three sections dealing with process and form: fluvial, glacial and other process domains. The final section covers the mid-century revolution, anticipating the onset of quantitative studies and dating techniques. The volume's objective is to describe and analyse many of the developments that provide a foundation for the rich and varied subject matter of contemporary geomorphology. The volume is in part a celebration of the late Professor Richard Chorley, who devised its structure and contributed a chapter.

Hockey's Hardest Hitting Book More than a personal memoir, this book describes the author's experiences with the players, ownership, and management of the Philadelphia Flyers: one of the National Hockey League's (NHL's) premier teams. For over six decades, Larry Clay has been a fan and keen observer of ice hockey, both in the USA and internationally. He's also a former coach, administrator, and hockey equipment retailer. This unique perspective gives Mr. Clay the ability to reveal misinformation (past and

present) from several sources (and organizations) concerning the state of ice hockey. You'll discover Why the author (and others) faced a shocking battle with Flyers former management. How the Flyer's ownership cost the franchise and their fans a dynasty. How the Broad Street Bullies Alumni were once nearly defeated by an amateur men's hockey team. Why the authors association with a former Flyer's Superstar went bad. The horrifying truth about the NHL and the NHLPA (the Players Union) and how much they really care about player safety. How the NHL (and government agencies) pushed the worst scandal in hockey history 'under the ice.' When Canada lost ownership of "their game" Plus much, much more! Writing in a blunt and direct style, Larry Clay takes you 'Behind The Orange Curtain' where each chapter tells a different story. Whether you're a serious or casual fan of the sport, you'll never look at professional ice hockey the same way again.

The discovery of ancient stone implements alongside the bones of mammoths by John Evans and Joseph Prestwich in 1859 kicked open the door for a time revolution in human history. Clive Gamble explores the personalities of these revolutionaries and the significant impact their work had on the scientific advances of the next 160 years.

#### *All Eyes on Me*

New science has surprised many by showing, contrary to received wisdom, that a real Adam and Eve could have lived amongst other humans in historical times and yet be the

ancestors of every living person, as traditional Christianity has always taught. This theory was first published in book form in 2019, but Jon Garvey, familiar with it from its early days, believes it helps confirm the Christian account of reality by giving it a solid foundation in science and history. In this book he argues that the long existence of other people before and alongside Adam was in all likelihood known to the Bible's original authors. This conclusion helps build a compelling biblical "big story" of a new kind of created order initially frustrated by Adam's failure, but finally accomplished in Christ. This "new creation" theme complements that of the "old creation" covered in his first book, *God's Good Earth*. The two together contribute to a unified, and fully orthodox, understanding of the overall message of the Bible.

#### Life on Ice

*The Alaskan Beaufort Sea: Ecosystems and Environments* provides an interdisciplinary view into almost all aspects of the environment, with a detailed survey of the background literature. This book focuses on the Alaskan Beaufort Shelf environment. Organized into four parts encompassing 20 chapters, this book begins with an overview of the characteristics and history of the region in

---

which the research took place and defines the objectives of the studies program. This text then examines the subsynoptic meteorological networks along the Beaufort Sea coast and shelf. Other chapters consider the thermally generated mesoscale effects on surface winds and the orographic mesoscale effects on surface winds. This book discusses as well the phytoplankton associations and relative phytoplankton production in the area between the 20-m depth contour and the edge of the ice in summer. The final chapter deals with the characteristics of the ice cover and oil-ice interactions that will affect cleanup activities after blowout. This book is a valuable resource for scientists and conservationists.

Key biogeochemical events in the ocean take place in less than a second, are studied in experiments lasting a few hours, and determine cycles that last over seasons or even years. Models of the controlling processes thus have to take into account these time scales. This book aims at achieving consensus among these controlling processes at all relevant time scales. It helps understand the global carbon cycle including the production and breakdown of dissolved organic matter and the production, sinking and breakdown of particles. The emphasis on considering all time scales in submodel formulation is new and of interest to all those working in global ocean models and related fields.
