While Aristotle acknowledges the connection between rhetoric, biology, and cognitive abilities, scholarship continues to struggle to integrate the fields of rhetoric and neurobiology. Drawing on recent work in neurorhetoric, this book offers a model that integrates multimodal rhetorical theory and multisensory neural processing theory pertaining to cognition and learning. Using existing theories from multimodal rhetoric and specific findings from neurobiological studies, the author develops a model that integrates concepts from both fields, bridging, if not

uniting, them. He also discusses possible applications of the new model, with specific case studies related to training and instruction. These applications include various media used in instructional and training contexts, such as print, slide shows, videos, simulations, and hands-on training. The book thus introduces concepts of cognitive neuroscience to multimodal rhetorical theory and facilitates theorization combining multimodal rhetoric and multisensory cognition, and serves as a vehicle by which readers can better understand the links between multimodal rhetoric and cognitive neuroscience associated with technical communication. Integrating case studies from industry and practice, the text makes explicit connections between academic scholarship and workplace preparation. It also describes how interdisciplinary research can contribute to pharmaceutical

research, as well as the development of productive instructional materials. Rhetoric is affected by how the brain of any member of a given audience can process information. This book can promote further research-qualitative and quantitative-to develop a better understanding of the relationship between multimodal messages and how the brain processes such information.

Developed as both an air superiority fighter and a long-range naval interceptor, Grumman's F-14 Tomcat was the U.S. Navy's primary fighter from 1974 until 2006. Over 700 were built. The F-14 flew its first combat missions shortly after its initial deployment in late 1974, flying in support of the American withdrawal from Saigon. In 1981 it drew first blood, as two F-14s from VF-41 downed two Libyan Su-22s. The plane compiled a notable combat record for the United States in both Gulf Wars and NATO actions in Bosnia. Planes sold to the Shah of Iran prior to his ouster remain the last F-14s in active service, as the U.S. Navy retired it in October 2006. This F-14 pilot's flight operating handbook was originally produced by the U.S. Navy. It has been slightly reformatted but is reproduced here in its entirety. It provides a fascinating view inside the cockpit of one of history's great planes.

Although applicable to all areas of human factors research, the old adage is especially relevant to simulation and training. As a tool, simulation is an aid to the

imagination, however, if incorrectly or inadequately used, it can lead to inaccurate outcomes that not only limit the possibilities but potentially cause harm. A comprehensive overview of the topic from a human factor perspective, *Human Factors in Simulation and Training* not only reflects the state-of-the art but also integrates the literature on simulation into a cohesive resource. The editors have collected chapters on a wide variety of topics, beginning with theory and application in areas ranging from traditional training to augmented reality to virtual reality. This coverage includes surface ships, submarines, naval aviation, commercial aviation, space, and medicine. The theory based section focuses on human factors aspects of simulation and training ranging from the history of simulators and training devices, to future trends in simulation from both a civilian and military perspective. The chapters expand on concepts regarding simulator usage particularly with respect to the validity and functionality of simulators as training devices. They contain in depth discussions of specific issues including fidelity, interfaces and control devices, transfer of training, simulator sickness, effects of motion in simulated systems, and virtual reality. As more, and more sophisticated, simulation tools and training technologies become available, a complete understanding of how to use them appropriately will be even more crucial. Elucidating theory and application, the book addresses numerous issues and concepts pertaining to human factors in

simulation and training, making this volume an important addition to the bookshelf of any human factors professional.

The F-89 made its debut in 1948, joined the Air Force in 1950, and then served as the mainstay of Air Defense Command for 17 years. Over 1,000 F-89s were produced, including 350 of the J₄ model equipped with pylons to carry the Genie. (One F-89 did fire the missile as part of Operation

Plumbob in 1957.) Originally printed by Northrop and the USAF, this F-89 Flight Operating Manual taught pilots everything they needed to know before entering the cockpit.
