National Oil Companies (NOCs)  
directly or indirectly  
control the majority of oil

and gas reserves. As such,  
they are of great consequence  
to their country's economy,  
to importing countries'  
energy security, and to the  
stability of oil and gas  
markets. The paper analyzes  
the available evidence on the  
objectives, governance and  
performance of 20 NOCs from  
both net importing and net  
exporting countries, and  
draws conclusions about the  
design of policies and  
measures that are more likely  
to lead to social value  
creation. NOCs differ from  
private companies on a number  
of very important variables,  
including the level of  
competition in the market in  
which they operate, their  
business profile along the  
sector value chain, and their  
degree of commercial  
orientation and  
internationalization. Most  
share some core

characteristics: they are usually tied to the 'national purpose' and serve political and economic goals other than maximizing the firm's profits. This paper introduces a conceptual model to analyze value creation by NOCs that takes into consideration their complex objective function. Our analysis aims to answer the following questions: Are certain corporate governance arrangements more suited than others to promote value creation? Is good geology a pre-condition for NOC value creation? Are there benefits from exposing the NOC to competition from private oil companies? Does the development of forward and backward linkages hamper NOC value creation?
