An introduction to a broad range of topics in deep learning, covering mathematical and conceptual background, deep learning techniques used in industry, and research perspectives. "Written by three experts in the field, Deep Learning is the only comprehensive book on the subject." —Elon Musk, cochair of OpenAI; cofounder and CEO of Tesla and SpaceX Deep learning is a form of machine learning that enables computers to learn from experience and understand the world in terms of a hierarchy of concepts. Because the computer gathers knowledge from experience, there is no need for a human computer operator to formally specify all the knowledge that the computer needs. The hierarchy of concepts allows the computer to learn complicated concepts by building them out of simpler ones; a graph of these hierarchies would be many layers deep. This book introduces a broad range of topics in deep learning. The text offers mathematical and conceptual background, covering relevant concepts in linear algebra, probability theory and information theory, numerical computation, and machine learning. It describes deep learning techniques used by practitioners in industry, including deep feedforward networks, regularization, optimization algorithms, convolutional networks, sequence modeling, and practical methodology; and it surveys such applications as natural language processing, speech recognition, computer vision, online recommendation systems, bioinformatics, and videogames. Finally, the book offers research perspectives, covering such theoretical topics as linear factor models, autoencoders, representation learning, structured probabilistic models, Monte Carlo methods, the partition function, approximate inference, and deep generative models. Deep Learning can be used by undergraduate or graduate students planning careers in either industry or research, and by software engineers who want to begin using deep learning in their products or platforms. A website offers supplementary material for both readers and instructors.

Introductory Statistics is designed for the one-semester, introduction to statistics course and is geared toward students majoring in fields other than math or engineering. This text assumes students have been exposed to intermediate algebra, and it focuses on the applications of statistical knowledge rather than the theory behind it. The foundation of this textbook is Collaborative Statistics, by Barbara Illowsky and Susan Dean. Additional topics, examples, and ample opportunities for practice have been added to each chapter. The development choices for this textbook were made with the guidance of many faculty members who are deeply involved in teaching this course. These choices led to innovations in art, terminology, and practical applications, all with a goal of increasing relevance and accessibility for students. We strove to make the discipline meaningful, so that students can draw from it a working knowledge that will enrich their future studies and help them make sense of the world around them.

In APPLE (SKIN TO

THE CORE), Eric Gansworth tells his story, the story of his family—of Onondaga among Tuscaroras—of Native folks everywhere. From the horrible legacy of the government boarding schools, to a boy watching his siblings leave and return and leave again, to a young man fighting to be an artist who balances multiple worlds. Eric shatters that slur and reclaims it in verse and prose and imagery that truly lives up to the word heartbreaking.

"Do we still know how to read a novel?" John Sutherland, Chairman of the 2005 Booker Prize Committee, asks. His disheartened answer is an unequivocal, "No." But Sutherland has not given up hope. With acerbic wit and intellect, he traces the history of what it used to mean to be well-read and tells readers what it still means today. Using this delightful book as a means to an end, he reminds readers how the delicate charms of fiction can be at once wonderful and inspired and infuriating. On one level this is a book about novels: how they work, what they're about, what makes them good or bad, and how to talk about them. At a deeper level, this is a book in which one of the most intimate tête-à-têtes is described—one in which a reader meets a novel. Will a great love affair begin? Will the rendezvous end in disappointment? Who can say? In order for the relationship to take its appropriate course all the details must be clearly acknowledged and understood for their complexities: plot, point of view,

---

character, style, pace, first and last sentences, and even beauty. Still, Sutherland knows a true understanding of fiction is more than a flirtation with text and style—it is a business. Taking his readers on a trip to the bookshop, he helps them judge a book by its cover based on design and color, wondering aloud what genre might be best, even going so far as to analyze one of the latest American bestsellers to further help the buying reader choose the novel that is right for him or her. In a book that is as wry and humorous as it is learned and opinionated, John Sutherland tells you everything you always wanted to know about how to read fiction better than you do now (but, were afraid to ask).
