Facts are and must be the coin of the realm in a democracy, for government “ of the people, by the people and for the people, ” requires and assumes to some extent an informed citizenry. Unfortunately, for citizens in the United States and throughout the world, distinguishing between fact and fiction has always been a formidable challenge, often with real life and death consequences. But now it is more difficult and confusing than ever. The Internet Age makes comment indistinguishable from fact, and erodes authority. It is liberating but annihilating at the same time. For those wielding power, whether in the private or the public sector, the increasingly sophisticated control of information is regarded as utterly essential to achieving success. Internal information is severely limited, including calendars, memoranda, phone logs and emails. History is sculpted by its absence. Often those in power strictly control the flow of information, corroding and corrupting its content, of course, using newspapers, radio, television and other mass means of communication to carefully consolidate their authority and cover their crimes in a thick veneer of fervent racialism or nationalism. And always with the specter of some kind of imminent public threat, what Hannah Arendt called ‘ objective enemies.’ ” An epiphanic, public comment about the Bush “ war on terror ” years was made by an unidentified White House official revealing how information is managed and how the news media and the public itself are regarded by those in power: “ [You journalists live] “ in what we call the reality-based community. [But] that's not the way the world really works anymore. We're an empire now, and when we act, we create our own reality . . . we're history's actors . . . and you, all of you, will be left to just study what we do. ” And yet, as aggressive as the Republican Bush administration was in attempting to define reality, the subsequent, Democratic Obama administration may be more so. Into the battle for truth steps Charles Lewis, a pioneer of journalistic objectivity. His book looks at the various ways in which truth can be manipulated and distorted by governments, corporations, even lone individuals. He shows how truth is often distorted or diminished by delay: truth in time can save terrible erroneous choices. In part a history of communication in America, a cri de coeur for the principles and practice of objective reporting, and a journey into several notably labyrinths of deception, 935 Lies is a valorous search for honesty in an age of casual, sometimes malevolent distortion of the facts.

This book, entitled Advances in Spatial Data Handling, is a compendium of papers resulting from the International Symposium on Spatial Data Handling (SDH), held in Ottawa, Canada, July 9-12, 2002. The SDH conference series has been organised as one of the main activities of the International Geographical Union (IGU) since it was first started in Zurich in 1984. In the late 1990 ' s the IGU Commission of Geographic Information Systems was discontinued and a study group was formed to succeed it in 1997. Much like the IGU Commission, the objectives of the Study Group are to create a network of people and research centres addressing geographical information science and to facilitate exchange of information. The International Symposium on Spatial Data Handling, which is the most important activity of the IGU Study Group, has, throughout its 18 year history been highly regarded as one of the most important GIS conferences in the world.

The age of the real-time supply chain has finally arrived. Thanks to an emerging technology construct--the Internet-based mega-portal--companies can now connect instantaneously with suppliers, distributors, manufacturers, customers, and alliance partners around the world. Online access to up-to-the-minute information enables companies to improve communication and project management across the entire supply chain, promote collaboration across departments, and enhance customer service and financial operations. The results are stunning; for example, a recent survey reports dramatic increases in revenues and customer retention and decreases in operating costs and product cycle times. Drawing from extensive primary research, this book presents detailed examples of how organizations as diverse as Coca-Cola Bottling Company, Dell, and the U.S. Department of Defense are creating information and communication hubs online and reaping the rewards. The authors explain the basic technical and organizational infrastructure necessary for launching a mega-portal and how its successful management can have profound impact on every area and function of the extended enterprise--from strategy to logistics, product development to customer service. As competition heats up from every direction, the ability to design and manage your supply chain with precision and speed becomes a business

Master a graph data modeling technique superior to traditional data modeling for both relational and NoSQL databases (graph, document, key-value, and column), leveraging cognitive psychology to improve big data designs. From Karen Lopez ' s Foreword: In this book, Thomas Frisendal raises important questions about the continued usefulness of traditional data modeling notations and approaches: Are Entity Relationship Diagrams (ERDs) relevant to analytical data requirements? Are ERDs relevant in the new world of Big Data? Are ERDs still the best way to work with business users to understand their needs? Are Logical and Physical Data Models too closely coupled? Are we correct in using the same notations for communicating with business users and developers? Should we refine our existing notations and tools to meet these new needs, or should we start again from a blank page? What new notations and approaches will we need? How will we use those to build enterprise database systems? Frisendal takes us through the history of data modeling, enterprise data models and traditional modeling methods. He points out, quite contentiously, where he feels we have gone wrong and in a few places where we got it right. He then maps out the psychology of meaning and context, while identifying important issues about where data modeling may or may not fit in business modeling. The main subject of this work is a proposal for a new exploration-driven modeling approach and new modeling notations for business concept models, business solutions models, and physical data models with examples on how to leverage those for implementing into any target database or datastore. These new notations are based on a property graph approach to modeling data.
