The Mom Test is a quick, practical guide that will save you time, money, and heartbreak. They say you shouldn't ask your mom whether your business is a good idea, because she loves you and will lie to you. This is technically true, but it misses the point. You shouldn't ask anyone if your business is a good idea. It's a bad question and everyone will lie to you at least a little . As a matter of fact, it's not their responsibility to tell you the truth. It's your responsibility to find it and it's worth doing right . Talking to customers is one of the foundational skills of both Customer

Development and Lean Startup. We all know we're supposed to do it, but nobody seems willing to admit that it's easy to screw up and hard to do right. This book is going to show you how customer conversations go wrong and how you can do better.

As online courses thrive due to the ease and availability of technology, cheating on tests is becoming a serious problem. With an increased need for enhancing test security, researchers are studying academic cheating from many angles,

including what cheating is, who cheats, why students cheat, what methods they use to cheat, factors affecting cheating, and what can be done to prevent cheating. Cheating is a complex issue with a wide range of types, causes and behaviors, including the motivation for test-takers to continuously devise new ways to cheat. Along with this general atmosphere, engineering, as a discipline is new to online education is at the stage of building up new online learning courses including online assessments. Most engineering courses consist of professional terminology and concepts that are unfamiliar and therefore require an arduous workload for students. Given this difficult situation, students take cheating as one of the reasonable strategies to employ throughout their coursework. The purpose of the study is to examine engineering students perceptions about cheating in order to construct online courses that minimizes cheating. Cheating can thwart test scores, or against the purpose of assessment, and to hamper the ability to provide students with diagnostic instruction rich in information. This study asks students whether they regard particular actions as cheating in online and in-person testing. It aims to provide information about cheating perceptions so that cheating can be prevented and academic achievements can be accurately measured. In order to apply students perceptions about cheating to design a course secure from cheating, McNemar tests with Bonferroni adjustment were applied to all 17 questions; the questions analyzed students responses and compared their perceptions on

cheating between online and in-person testing settings. Implications of the results showed in which setting it was easiest to cheat, which specific behavior was easiest to recognize as cheating, and which aspects of testing should be most carefully constructed when designing a dual-setting course that includes both online and in-class lectures and assessments.
