For the world's leading car-makers, the early 1990s brought radical changes. The reports published by MIT shocked management in European and American industries. Former major companies had to face consequences no one had expected. The assembly-lines were reorganized in order to achieve higher quality at lower costs. Five years after the MIT report, this book poses the question: What are the results of this revolution in work organization? Scientists and practitioners, many of them involved in earlier reports, evaluate the changes to the automotive industry in Europe and Japan. An insight into recent concepts in automation and the organization of production.

Aline Leon ? In the last years, public attention was increasingly shifted by the media and world governments to the concepts of saving energy, reducing pollution, protecting the environment, and developing long-term energy supply solutions. In parallel, research funding relating to alternative fuels and energy carriers is increasing on both national and international levels. Why has future energy supply become such a matter of concern? The reasons are the problems created by the world's current energy supply system which is mainly based on fossil fuels. In fact, the energy stored in hydrocarbon-based solid, liquid, and gaseous fuels was, is, and will be widely consumed for internal combustion engine-based transportation, for electricity and heat generation in residential and industrial sectors, and for the production of fertilizers in agriculture, as it is convenient, abundant, and cheap. However, such a widespread use of fossil fuels by a constantly growing world population (from 2.3 billion in 1939 to 6.5 billion in 2006) gives rise to the two problems of oil supply and environmental degradation. The problem related to oil supply is caused by the fact that fossil fuels are not renewable primary energy sources: This means that since the first barrel of petroleum has been pumped out from the ground, we have been exhausting a heritage given by nature.

This Open Access biography chronicles the life and achievements of the Norwegian engineer and physicist Rolf Widerøe. Readers who meet him in the pages of this book will wonder why he isn't better known. The first of Widerøe's many pioneering contributions in the field of accelerator physics was the betatron. He later went on to build the first radiation therapy machine, an advance that would eventually revolutionize cancer treatment. Hospitals worldwide installed his machine, and today's modern radiation treatment equipment is based on his inventions. Widerøe's story also includes a fair share of drama, particularly during World War II when both Germans and the Allies vied for his collaboration. Widerøe held leading positions in multinational industry groups and was one of the consultants for building the world's largest nuclear laboratory, CERN, in Switzerland. He gained over 200 patents, received several honorary doctorates and a number of international awards. The author, a professional writer and maker of TV documentaries, has gained access to hitherto

restricted archives in several countries, which provided a wealth of new known work by a master of modern French literature. Much acclaimed material and insights, in particular in relation to the war years. She tells here a gripping and illuminating story.
