Operations Management in the Supply Chain McGraw-Hill/Irwin
Total Operations Solutions builds on concepts that were introduced in "Total Manufacturing Solutions", Basu and Wright (1997). It demonstrates how this holistic approach of operational excellence driven by a self-

assessment methodology can be applied equally to manufacturing, service or public sectors. The text covers an implementation programme to demonstrate how to put the methodology into practice. a differentiating feature of the approach will be a critical update, impact analysis and comparison with new developments such as e-Business, outsourcing, Six Sigma, EFQM and ISO 9000:2000. It is a step-by-step guide for the application of the appropriate tools to the improvement process. Total Operations Solutions could be used as an essential handbook for all employees in a Six Sigma programme

and provide a better understanding of basic tools and techniques to help them to support a quality improvement initiative and sustain a strong competitive position.

Supply Chain Optimization, Management and Integration: Emerging Applications CRC Press

The focus of Supply Chain Engineering is the engineering design and planning of supply chain systems. There exists a very large variety of supply chain system types, all with different goals, constraints, and decisions, but a systematic approach for the design and planning of any supply chain can be based on the principles and methods of system engineering. In this book, author Marc Goetschalckx presents material developed at the Georgia Tech Supply Chain and Logistics Institute, the largest supply chain and logistics research and education program in the world. The book can be roughly divided into four sections. The first section focuses on data management. Since most of planning and design requires making decisions today so that supply chain functions can be executed efficiently in the future, this section

introduces forecasting principles and techniques. The second section of the book focuses on transportation systems. First, the characteristics of transportation assets and infrastructure are shown. Then four chapters focus on the planning of transportation activities depending on who controls the transportation assets. The third section of the book is focused on storing goods, and the last section of the book is focused on supply chain systems that consider simultaneously procurement, production, and transportation and inventory as well as the design of the supply chain infrastructure or network design. In each chapter, first a model of the process being studied is developed followed by a description of practical solution algorithms. More advanced material is typically described in appendices. This makes it possible to use an integrated, breath-first treatment of supply chain systems by using the initial material in each chapter. A more in depth treatment of a specific topic or process can be found towards the end of each chapter. End-of-chapter exercises are included throughout. This text is suitable for several target audiences. The first target is a course for upper-level undergraduate students on supply chains. The

second target is the use in a capstone senior design project in the supply chain area. The third target is an introductory course on supply chains either in a master of engineering or a master of business administration program, and the final audience consists of students attending logistics or supply chain post-graduate or continuing education courses.

To an increasing extent, corporations are recognizing the strategic role of the operations function. These organizations are

discovering that a focus on customer needs is effective only if the operations function is designed and managed to meet those needs. From acquiring raw materials to fabricating parts, to assembling products, to customer delivery, a total systems perspective can enable us, in the ideal, to fashion an operations function like the inner workings of a finely tuned machine (Like clockwork as we used to say in the days before electronic time pieces!). Life would be uninteresting without change, however, so we can be thankful that operating systems are dynamic in nature. We alter one element and others are affected. We introduce variability at one point and watch the ripple effects over time. These system behaviors can be difficult to grasp and even more difficult to predict. In addition to understanding the dynamic, integrated nature of systems it is important to understand and to practice the tools supporting the management of these systems. Teaching the concepts of modern information systems and the ability of these systems to enhance competitiveness are an important challenge to any I.E or MBA program.

Master's Thesis from the year 2005 in the subject Computer Science - Commercial Information Technology, grade: 1,7, University of Auckland (Faculty of Computing), course: Master of Computing, 83 entries in the bibliography, language: English, abstract: Supply chain management (SCM) offers business benefits but is a difficult concept to master without the right software support. This dissertation is aimed at academic and IT professionals and SCM decision makers or consultants as it provides insights into SCM software and the leading concepts behind it. A qualitative approach was chosen for answering the research questions which focus on general SCM software principles but also enquire benefits, functionalities and the software architecture of SAP's SCM 4.1 solution. In addition to that, the differences between what decision makers request and what mySAP SCM 4.1 offers are addressed with the research questions. To answer these research questions, the structure of the dissertation contains a general introduction to SCM software and includes a SCM software market overview. After this part, one major part of the dissertation contains an analysis of the dominant SCM software solution mySAP SCM (Release 4.1). The examination of mySAP SCM 4.1 focuses first on technological aspects (software architecture, technological platform and programming language) before the

business benefits and functionalities of this SCM software are examined. After that, the functionalities, business benefits and the architecture of mySAP SCM 4.1 are compared with the SCM software requirements obtained from ten SCM professionals from different industries (automotive, logistics, retail, consumer packaged goods, consulting and education). The analysis of the requirements from SCM decision makers (gathered using a questionnaire) shows that an increase in SCM transparency and a reduction of SCM costs were the main requirements articulated by decision makers.
