Geneticists and molecular biologists have been interested in quantifying genes and their products for many years and for various reasons (Bishop, 1974). Early molecular methods were based on molecular

hybridization, and were devised shortly after Marmur and Doty (1961) first showed that denaturation of the double helix could be reversed - that the process of molecular reassociation was exquisitely sequence dependent. Gillespie and Spiegelman (1965) developed a way of using the method to titrate the number of copies of a probe within a target sequence in which the target sequence was fixed to a membrane support prior to hybridization with the probe - typically a RNA. Thus, this was a precursor to many of the methods still in use, and indeed under development, today. Early examples of the application of these methods included the measurement of the copy numbers in gene families such as the ribosomal genes and the immunoglobulin family. Amplification of genes in tumors and in response to drug treatment was discovered by this method. In the same period, methods were invented for estimating gene numbers based on the kinetics of the reassociation process - the so-called Cot analysis. This method, which exploits the dependence of the rate of reassociation on the concentration of the two strands, revealed the presence of repeated sequences in the DNA of higher eukaryotes (Britten and Kohne, 1968). An adaptation to RNA, Rot analysis (Melli and Bishop, 1969), was used to measure the abundance of RNAs in a mixed population.

E-waste management is a serious challenge across developed, transition, and developing countries because of the consumer society and the globalization process. E-waste is a fast-growing waste stream which needs more attention of international organizations, governments, and local authorities in order to improve the current waste management practices. The book reveals the pollution side of this waste stream with critical implications on the environment and public health, and also it points out the resource side which must be further developed under the circular economy framework with respect to safety regulations. In this context, complicated patterns at the global scale emerge under legal and illegal e-waste trades. The linkages between developed and developing countries and key issues of e-waste management sector are further examined in the book.

HUMAN COMMUNICATION TECHNOLOGY A unique book explaining how perception, location, communication, cognition, computation, networking, propulsion, integration of federated Internet of Robotic Things (IoRT) and digital platforms are important components of new-generation IoRT applications through continuous, real-time interaction with the world. The 16 chapters in this book discuss new architectures, networking paradigms, trustworthy structures, and platforms for the integration of applications across various business and industrial domains that are needed for the emergence of intelligent things (static or mobile) in collaborative autonomous fleets. These new apps speed up the progress of paradigms of autonomous system design and the proliferation of the Internet of Robotic Things (IoRT). Collaborative robotic things can communicate with other things in the IoRT, learn independently, interact securely with the world, people, and other things, and acquire characteristics that make them self-maintaining, self-aware, self-healing, and fail-safe operational. Due to the ubiquitous nature of collaborative robotic things, the IoRT, which binds together the sensors and the objects of robotic things, is gaining popularity. Therefore, the information contained in this book will provide readers with a better understanding of this interdisciplinary field. Audience Researchers in various fields including computer science, IoT, artificial intelligence, machine learning, and big data analytics.

Constraints have emerged as the basis of a representational and computational paradigm that draws from many disciplines and can be brought to bear on many problem domains. This volume contains papers dealing with all aspects of computing with constraints. In particular, there are several papers on applications of constraints, reflecting the practical usefulness of constraint programming. The papers were presented at the 1998 International Conference on Principles and Practice of Constraint Programming (CP'98), held in Pisa, Italy, 26-30 October, 1998. It is the fourth in this series of conferences, following conferences in Cassis (France), Cambridge (USA), and Schloss Hagenberg (Austria). We received 115 high quality submissions. In addition, 7 abstracts submissions were not followed by a full paper, hence were not counted as submissions. The program committee selected 29 high quality papers after thorough refereeing by at least 3 experts and further discussion by committee members. We thank the referees and the program committee for the time and effort spent in reviewing the papers. The program committee invited three speakers: { Joxan Jarar { Peter Jeavons { Patrick Prosser Their papers are in this volume.

In *Digital Archaeology*, expert practitioner
Michael Graves has written the most
thorough, realistic, and up-to-date guide
to the principles and techniques of modern
digital forensics. He begins by providing a
solid understanding of the legal
underpinnings and critical laws affecting
computer forensics, including key
principles of evidence and case law. Next,
he explains how to systematically and
thoroughly investigate computer systems to
unearth crimes or other misbehavior, and
back it up with evidence that will stand up
in court. Drawing on the analogy of
archaeological research, Graves explains
each key tool and method investigators use
to reliably uncover hidden information in
digital systems. Graves concludes by
presenting coverage of important
professional and business issues associated
with building a career in digital
forensics, including current licensing and
certification requirements.

Magicians have dazzled audiences for many
centuries; however, few researchers have

studied how, let alone why, most tricks work.
The psychology of magic is a nascent field of
research that examines the underlying
mechanisms that conjurers use to achieve
enchancing phenomena, including sensory
illusions, misdirection of attention, and the
appearance of mind-control and nuanced
persuasion. Most studies to date have focused
on either the psychological principles
involved in watching and performing magic or
"neuromagic" - the neural correlates of such
phenomena. Whereas performers sometimes
question the contributions that modern science
may offer to the advancement of the magical
arts, the history of magic reveals that
scientific discovery often charts new
territories for magicians. In this research
topic we sketch out the symbiotic relationship
between psychological science and the art of
magic. On the one hand, magic can inform
psychology, with particular benefits for the
cognitive, social, developmental, and
transcultural components of behavioural
science. Magicians have a large and robust set
of effects that most researchers rarely
exploit. Incorporating these effects into
existing experimental, even clinical,
paradigms paves the road to innovative
trajectories in the study of human behaviour.
For example, magic provides an elegant way to
study the behaviour of participants who may
believe they had made choices that they
actually did not make. Moreover, magic fosters
a more ecological approach to experimentation
whereby scientists can probe participants in
more natural environments compared to the
traditional lab-based settings. Examining how
magicians consistently influence spectators,
for example, can elucidate important aspects
in the study of persuasion, trust, decision-
making, and even processes spanning authorship
and agency. Magic thus offers a largely
underused armamentarium for the behavioural
scientist and clinician. On the other hand,
psychological science can advance the art of

magic. The psychology of deception, a
relatively understudied field, explores the
intentional creation of false beliefs and how
people often go wrong. Understanding how to
methodically exploit the tenuous twilight zone
of human vulnerabilities - perceptual,
logical, emotional, and temporal - becomes all
the more revealing when top-down influences,
including expectation, symbolic thinking, and
framing, join the fray. Over the years,
science has permitted magicians to concoct
increasingly effective routines and to elicit
heightened feelings of wonder from audiences.
Furthermore, on occasion science leads to the
creation of novel effects, or the refinement
of existing ones, based on systematic methods.
For example, by simulating a specific card
routine using a series of computer stimuli,
researchers have decomposed the effect and
reconstructed it into a more effective
routine. Other magic effects depend on
meaningful psychological knowledge, such as
which type of information is difficult to
retain or what changes capture attention.
Behavioural scientists measure and study these
factors. By combining analytical findings with
performer intuitions, psychological science
begets effective magic. Whereas science
strives on parsimony and independent
replication of results, magic thrives on
reproducing the same effect with multiple
methods to obscure parsimony and minimise
detection. This Research Topic explores the
seemingly orthogonal approaches of scientists
and magicians by highlighting the crosstalk as
well as rapprochement between psychological
science and the art of deception.

When *Adorned in Dreams* was first published in
1985, Angela Carter described the book as "the
best I have read on the subject, bar none."
From haute couture to haberdashery, "deviant"
dress to Dior, Elizabeth Wilson traces the
social and cultural history of fashion and its

complex relationship to modernity. She also discusses fashion's vociferous opponents, from the "dress reform" movement to certain strands of feminism. Wilson delights in the power of fashion to mark out identity or subvert it. This brand new edition of her book follows recent developments to bring the story of fashionable dress up to date, exploring the grunge look inspired by bands like Nirvana, the "boho chic" of the mid 90's, retro-dressing, and the meanings of dress from the veil to soccer player David Beckham's pink-varnished toenails.
