"This course and this book are about management and managers. Managers are one thing that all organizations--no matter the size, kind, or location--need. And there's no doubt that the world managers face has changed, is changing, and will continue to change. The dynamic nature of today's organizations means both rewards and challenges for the individuals who will be managing those organizations. Management is a dynamic subject, and a textbook on it should reflect those changes to help prepare you to manage under the current conditions. We've written this 14th edition of Management to provide you with the best possible understanding of what it means to be a manager confronting change and to best prepare you for that reality. But not every student aspires to a career in management. And even if you do, you may be five or ten years away from reaching a managerial position. So you might rightly feel that taking a course in management now may be getting ahead of the game. We hear you. In response to these concerns, we've added new material to this book that is important and relevant to everyone working in an organization--manager and non-manager alike. Our "Workplace Confidential" pages identify, analyze, and offer suggestions for dealing with the major challenges that surveys indicate frustrate employees the most. You should find these pages valuable for helping you survive and thrive in your workplace. Surprisingly, this topic has rarely been addressed in business programs. Inclusion in an introductory management course appeared to us to be a logical place to introduce these challenges and to provide guidance in handling them"--

Herbert Simon's classic work on artificial intelligence in the expanded and updated third edition from 1996, with a new introduction by John E. Laird. Herbert Simon's classic and influential The Sciences of the Artificial declares definitively that there can be a science not only of natural phenomena but also of what is artificial. Exploring the commonalities of artificial systems, including economic systems, the business firm, artificial intelligence, complex engineering projects, and social plans, Simon argues that designed systems are a valid field of study, and he proposes a science of design. For this third edition, originally published in 1996, Simon added new material that takes into account advances in cognitive psychology and the science of design while confirming and extending the book's basic thesis: that a physical symbol system has the necessary and sufficient means for intelligent action. Simon won the Nobel Prize for Economics in 1978 for his research into the decision-making process within economic organizations and the Turing Award (considered by some the computer science equivalent to the Nobel) with Allen Newell in 1975 for contributions to artificial intelligence, the psychology of human cognition, and list processing. The Sciences of the Artificial distills the essence of Simon's thought accessibly and coherently. This reissue of the third edition makes a pioneering work available to a new audience.

Class has always played a role in American religion. Class differences in religious life are inevitably felt by both those in the pews and those on the outside looking in. This volume starts a long overdue discussion about how class continues to matter - and perhaps even ways in which it does not - in American religion. Class is indeed important, whether one examines it through analysis of events and documents, surveys and interviews, or participant observation of religious groups. The chapters herein examine class as a reality that is both material and symbolic, individual and corporate. "Religion and Class in America" examines the myriad ways in which class continues to interact with the theologies, practices, beliefs, and group affiliations of American religion.

In a turbulent world where companies are trying to realign their resources faster than the competition, resilience is defined as the capability to absorb strain and recover from untoward events through continuous reconstruction. Resilience implies a capacity to be robust under conditions of stress and change (Coutu 2002). It can be achieved by creating and maintaining cognitive, emotional, relational, or structural capabilities sufficiently convertible and malleable to cope with a dynamic environment. In the competitive marketplace, many countries are making the transition from technology-importing, efficiency-based development to innovation-based development. Organizations located in so-called "first world" economies are increasingly concerned with making local enterprises more resilient in their current geographical location and firms in "third world" economies are keen to establish and retain knowledge-based economic activities. The focus of this conference is on how IT innovation can contribute to making organizations more resilient. Commercial organizations are trying to make sense of the competitive environment and quickly generate new strategic options. Public organizations are struggling to meet societal needs for innovative information services. IT staff have spent much of their energy improving transactional efficiency. IT now needs to be seen as a positive force for making business innovation resilient. Issues such as IT

organizational design, social networking, diversity, improvisation, and rich media are likely to advance our understanding of resilience in this context, and account for an organization's need to sustain innovation.

Research Methods in Criminal Justice and Criminology connects key concepts to real field research and practices using contemporary examples and recurring case studies throughout the book that demonstrate how concepts relate to students' lives. Authors Callie M. Rennison and Timothy C. Hart introduce practical research strategies used in criminal justice to show students how a research question can become a policy that changes or influences criminal justice practices. The book's student-driven approach addresses both the "why" and the "how" as it covers the research process and focuses on the practical application of data collection and analysis. By demonstrating the variety of ways research can be used, and reinforcing the need to discern quality research, the book prepares students to become critical consumers and ethical producers of research. The Second Edition includes two new case studies woven throughout, and new expert profiles to highlight contemporary topics. Editable PowerPoint slides and a test bank are available to instructors.

This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.
